The technical committees responsible for ACI committee reports and standards strive to avoid ambiguities, omissions, and errors in these documents. In spite of these efforts, the users of ACI documents occasionally find information or requirements that may be subject to more than one interpretation or may be incomplete or incorrect. Users who have suggestions for the improvement of ACI documents are requested to contact ACI. Proper use of this document includes periodically checking for errata at www.concrete.org/committees/errata.asp for the most up-to-date revisions.

ACI committee documents are intended for the use of individuals who are competent to evaluate the significance and limitations of its content and recommendations and who will accept responsibility for the application of the material it contains. Individuals who use this publication in any way assume all risk and accept total responsibility for the application and use of this information.

All information in this publication is provided “as is” without warranty of any kind, either express or implied, including but not limited to, the implied warranties of merchantability, fitness for a particular purpose or non-infringement.

ACI and its members disclaim liability for damages of any kind, including any special, indirect, incidental, or consequential damages, including without limitation, lost revenues or lost profits, which may result from the use of this publication.

It is the responsibility of the user of this document to establish health and safety practices appropriate to the specific circumstances involved with its use. ACI does not make any representations with regard to health and safety issues and the use of this document. The user must determine the applicability of all regulatory limitations before applying the document and must comply with all applicable laws and regulations, including but not limited to, United States Occupational Safety and Health Administration (OSHA) health and safety standards.

Order information: ACI documents are available in print, by download, on CD-ROM, through electronic subscription, or reprint and may be obtained by contacting ACI.

Most ACI standards and committee reports are gathered together in the annually revised ACI Manual of Concrete Practice (MCP).

This guide presents information on the design of slabs-on-ground, primarily industrial floors. It addresses the planning, design, and detailing of slabs. Background information on design theories is followed by discussion of the types of slabs, soil-support systems, loadings, and jointing. Design methods are given for unreinforced concrete, reinforced concrete, shrinkage-compensating concrete, post-tensioned concrete, fiber-reinforced concrete slabs-on-ground, and slabs-on-ground in refrigerated buildings, followed by information on shrinkage and curling. Advantages and disadvantages of these slab design methods are provided, including the ability of some slab designs to minimize cracking and curling more than others. Even with the best slab designs and proper construction, it is unrealistic to expect crack-free and curl-free floors. Every owner should be advised by the designer and contractor that it is normal to expect some cracking and curling on every project. This does not necessarily reflect adversely on the adequacy of the floor’s design or quality of construction. Design examples are given.

Keywords: curling; design; floors-on-ground; grade floors; industrial floors; joints; load types; post-tensioned concrete; reinforcement (steel, fibers); shrinkage; shrinkage-compensating; slabs; slabs-on-ground; soil mechanics; warping.
Chapter 5—Loads, p. 360R-18
5.1—Introduction
5.2—Vehicular loads
5.3—Concentrated loads
5.4—Distributed loads
5.5—Line and strip loads
5.6—Unusual loads
5.7—Construction loads
5.8—Environmental factors
5.9—Factors of safety

Chapter 6—Joints, p. 360R-22
6.1—Introduction
6.2—Load-transfer mechanisms
6.3—Sawcut contraction joints
6.4—Joint protection
6.5—Joint filling and sealing

Chapter 7—Design of unreinforced concrete slabs, p. 360R-31
7.1—Introduction
7.2—Thickness design methods
7.3—Shear transfer at joints
7.4—Maximum joint spacing

Chapter 8—Design of slabs reinforced for crack-width control, p. 360R-34
8.1—Introduction
8.2—Thickness design methods
8.3—Reinforcement for crack-width control only

Chapter 9—Design of shrinkage-compensating concrete slabs, p. 360R-34
9.1—Introduction
9.2—Thickness determination
9.3—Reinforcement
9.4—Other considerations

Chapter 10—Design of post-tensioned slabs-on-ground, p. 360R-38
10.1—Introduction
10.2—Applicable design procedures
10.3—Slabs post-tensioned for crack control
10.4—Industrial slabs with post-tensioned reinforcement for structural support

Chapter 11—Fiber-reinforced concrete slabs-on-ground, p. 360R-40
11.1—Introduction
11.2—Synthetic fiber reinforcement
11.3—Steel fiber reinforcement

Chapter 12—Structural slabs-on-ground supporting building code loads, p. 360R-44
12.1—Introduction
12.2—Design considerations

Chapter 13—Design of slabs for refrigerated facilities, p. 360R-44
13.1—Introduction
13.2—Design and specification considerations
13.3—Temperature drawdown

Chapter 14—Reducing effects of slab shrinkage and curling, p. 360R-45
14.1—Introduction
14.2—Drying and thermal shrinkage
14.3—Curling and warping
14.4—Factors that affect shrinkage and curling
14.5—Compressive strength and shrinkage
14.6—Compressive strength and abrasion resistance
14.7—Removing restraints to shrinkage
14.8—Base and vapor retarders/barriers
14.9—Distributed reinforcement to reduce curling and number of joints
14.10—Thickened edges to reduce curling
14.11—Relation between curing and curling
14.12—Warping stresses in relation to joint spacing
14.13—Warping stresses and deformation
14.14—Effect of eliminating sawcut contraction joints with post-tensioning or shrinkage-compensating concrete
14.15—Summary and conclusions

Chapter 15—References, p. 360R-53
15.1—Referenced standards and reports
15.2—Cited references

Appendix 1—Design examples using Portland Cement Association method, p. 360R-58
A1.1—Introduction
A1.2—The PCA thickness design for single-axle load
A1.3—The PCA thickness design for slab with post loading
A1.4—Other PCA design information

Appendix 2—Slab thickness design by Wire Reinforcement Institute method, p. 360R-60
A2.1—Introduction
A2.2—The WRI thickness selection for single-axle wheel load
A2.3—The WRI thickness selection for aisle moment due to uniform loading

Appendix 3—Design examples using Corps of Engineers’ charts, p. 360R-63
A3.1—Introduction
A3.2—Vehicle wheel loading
A3.3—Heavy lift truck loading

Appendix 4—Slab design using post-tensioning, p. 360R-63
A4.1—Design example: Post-tensioning to minimize cracking
A4.2—Design example: Equivalent tensile stress design

Appendix 5—Design example using shrinkage-compensating concrete, p. 360R-65
A5.1—Introduction
A5.2—Example selecting the optimum amount of reinforcement to maximize the compressive stress in the concrete where the slab thickness, the joint spacing, and prism expansion are known

Appendix 6—Design examples for steel FRC slabs-on-ground using yield line method, p. 360R-66
A6.1—Introduction
A6.2—Assumptions and design criteria

Appendix 7—Construction document information, p. 360R-67
A7.1—Introduction
A7.2—Example design criteria
A7.3—Typical details

Conversion factors, p. 360R-72

CHAPTER 1—INTRODUCTION

1.1—Purpose and scope
This guide presents information on the design of slabs-on-ground. Design is the decision-making process of planning, sizing, detailing, and developing specifications preceding construction of slabs-on-ground. Information on other aspects, such as materials, construction methods, placement of concrete, and finishing techniques is included only where needed in making design decisions.

In the context of this guide, slab-on-ground is defined as: a slab, supported by ground, whose main purpose is to support the applied loads by bearing on the ground. The slab is of uniform or variable thickness and it may include stiffening elements such as ribs or beams. The slab may be unreinforced or reinforced with nonprestressed reinforcement, fibers, or post-tensioned tendons. The reinforcement may be provided to limit crack widths resulting from shrinkage and temperature restraint and the applied loads. Post-tensioning tendons may be provided to minimize cracking due to shrinkage and temperature restraint, resist the applied loads, and accommodate movements due to expansive soil volume changes.

This guide covers the design of slabs-on-ground for loads from material stored directly on the slab, storage rack loads, and static and dynamic loads associated with equipment and vehicles. Other loads, such as roof loads transferred through dual-purpose rack systems, are also mentioned.

This guide discusses soil-support systems, shrinkage and temperature effects; cracking, curling or warping; and other concerns affecting slab design. Although the same general principles are applicable, this guide does not specifically address the design of roadway pavements, airport pavements, parking lots, or mat foundations.

1.2—Work of ACI Committee 360 and other relevant committees
There are several ACI committees listed below that provide relevant information concerning slabs-on-ground design and construction or similar slab types that are not addressed in this guide such as pavements, parking lots, or mat foundations. These committees provide documents where more detailed information for topics discussed in this guide can be found.

1.2.1 ACI Committee 117 develops and reports information on tolerances for concrete construction through liaison with other ACI committees.
1.2.2 ACI Committee 223 develops recommendations on the use of shrinkage-compensating concrete.
1.2.3 ACI Committee 301 develops and maintains specifications for concrete construction.
1.2.4 ACI Committee 302 develops and reports information on materials and procedures for the construction of concrete floors. ACI 302.1R provides guidelines and recommendations on materials and slab construction. ACI 302.2R provides guidelines for concrete slabs that receive moisture-sensitive flooring materials.
1.2.5 ACI Committee 318 develops and maintains building code requirements for structural concrete.
1.2.6 ACI Committee 325 develops and reports information on concrete pavements.
1.2.7 ACI Committee 330 develops and reports information on concrete parking lots and paving sites. Parking lots and paving sites have unique considerations that are covered in ACI 330R.
1.2.8 ACI Committee 332 develops and reports information on concrete in residential construction.
1.2.9 ACI Committee 336 develops and reports information on footings, mats, and drilled piers. The design procedures for combined footings and mat foundations are given in ACI 336.2R. Mat foundations are typically more rigid and more heavily reinforced than common slabs-on-ground.
1.2.10 ACI Committee 360 develops and reports information on the design of slabs-on-ground, with the exception of highways, parking lots, airport pavements, and mat foundations.
1.2.11 ACI Committee 544 develops and reports information on concrete reinforced with short, discontinuous, randomly-dispersed fibers. ACI 544.3R is a guide for specifying, proportioning, and production of fiber-reinforced concrete (FRC).

1.3—Work of non-ACI organizations
Numerous contributions of slabs-on-ground design and construction information used in this guide come from organizations and individuals outside the American Concrete Institute. The U.S. Army Corps of Engineers (USACE), the National Academy of Science, and the Department of Housing and Urban Development (HUD) have developed guidelines for floor slab design and construction. The Portland Cement Association (PCA), Wire Reinforcement Institute (WRI), Concrete Reinforcing Steel Institute (CRSI), Post-Tensioning Institute (PTI), as well as several universities and consulting engineers have studied slabs-on-ground and developed recommendations for their design and construction. In addition, periodicals such as Concrete International and Concrete Construction have continuously disseminated information about slabs-on-ground.

1.4—Design theories for slabs-on-ground

1.4.1 Introduction—Stresses in slabs-on-ground result from applied loads and volume changes of the soil and concrete. The magnitude of these stresses depends on factors such as the degree of slab continuity, subgrade strength and
