The technical committees responsible for ACI committee reports and standards strive to avoid ambiguities, omissions, and errors in these documents. In spite of these efforts, the users of ACI documents occasionally find information or requirements that may be subject to more than one interpretation or may be incomplete or incorrect. Users who have suggestions for the improvement of ACI documents are requested to contact ACI via the errata website at [www.concrete.org/committees/errata.asp](http://www.concrete.org/committees/errata.asp). Proper use of this document includes periodically checking for errata for the most up-to-date revisions.

ACI committee documents are intended for the use of individuals who are competent to evaluate the significance and limitations of its content and recommendations and who will accept responsibility for the application of the material it contains. Individuals who use this publication in any way assume all risk and accept total responsibility for the application and use of this information.

All information in this publication is provided “as is” without warranty of any kind, either express or implied, including but not limited to, the implied warranties of merchantability, fitness for a particular purpose or non-infringement.

ACI and its members disclaim liability for damages of any kind, including any special, indirect, incidental, or consequential damages, including without limitation, lost revenues or lost profits, which may result from the use of this publication.

It is the responsibility of the user of this document to establish health and safety practices appropriate to the specific circumstances involved with its use. ACI does not make any representations with regard to health and safety issues and the use of this document. The user must determine the applicability of all regulatory limitations before applying the document and must comply with all applicable laws and regulations, including but not limited to, United States Occupational Safety and Health Administration (OSHA) health and safety standards.

**Order information:** ACI documents are available in print, by download, on CD-ROM, through electronic subscription, or reprint and may be obtained by contacting ACI.

Most ACI standards and committee reports are gathered together in the annually revised *ACI Manual of Concrete Practice* (MCP).

*High-strength concrete (HSC) has emerged as a viable material to use as an alternative to conventional normal-strength concrete in infrastructure systems to reduce member cross section, extend member span length, reduce the number of system members, or enhance system sustainability. This guide offers general information on the quality control and testing of HSC. Recommendations are based on the current state of knowledge gained from worldwide experimental research, analytical work, and field applications of HSC systems used in concrete structures.*

**Keywords:** acceptance criteria; compressive strength; concrete placement; creep; curing; delivery; modulus of elasticity; sampling; shrinkage; statistical concepts; strength evaluation; testing; trial batching; quality assurance; quality control.

ACI Committee Reports, Guides, Manuals, and Commentaries are intended for guidance in planning, designing, executing, and inspecting construction. This document is intended for the use of individuals who are competent to evaluate the significance and limitations of its content and recommendations and who will accept responsibility for the application of the material it contains. The American Concrete Institute disclaims any and all responsibility for the stated principles. The Institute shall not be liable for any loss or damage arising therefrom.

Reference to this document shall not be made in contract documents. If items found in this document are desired by the Architect/Engineer to be a part of the contract documents, they shall be restated in mandatory language for incorporation by the Architect/Engineer.

## CONTENTS

### Chapter 1—Introduction and scope, p. 2

- 1.1—Introduction
- 1.2—Scope

### Chapter 2—Notation and definitions, p. 2

- 2.1—Notation
- 2.2—Definitions

### Chapter 3—Planning, p. 3

- 3.1—Introduction
- 3.2—Preconstruction meeting
- 3.3—Trial batches
- 3.4—Prequalification of concrete suppliers and preconstruction testing

### Chapter 4—Quality assurance and quality control, p. 6

- 4.1—Introduction

ACI 363.2R-11 supersedes ACI 363.2R-98 and was adopted and published July 2011.

- 7.2—Cited references

## CHAPTER 1—INTRODUCTION AND SCOPE

### 1.1—Introduction

The cement and concrete industry's interest in high-strength concrete prompted the American Concrete Institute to form ACI Committee 363 in 1979. The mission of the committee was to study and report information on high-strength concrete (HSC). HSC is considered one type of high-performance concrete (HPC) that is most often specified for enhanced strength characteristics, although may also be specified for its improved durability. ACI 363R was the first document produced by this committee in 1984, and contained significant information regarding material selection, mixing and placing, inspection and testing, physical properties, structural design, economics, and examples of applications.

This guide is an extension of ACI 363R and presents guidelines to facilitate the proper evaluation of HSC through correct quality control (QC) and testing. HSCs may be produced with innovative materials and procedures not covered in this guide. This guide is not intended to restrict the use of new or innovative QC practices or testing methods as they become available or necessary. The user is cautioned that this guide is for general usage only, and individual projects may require additional QC and testing effort.

### 1.2—Scope

This guide discusses QC and testing practices of HSC. HSC usually is associated with structures that have been optimized for performance. Therefore, a high degree of confidence in concrete quality should be achieved through the inspection and testing process. This process can be conducted by the producer and contractor as QC and by the owner or the owner's representative as quality assurance (QA). Those involved in QC and testing need to know the unique characteristics of HSC

to better assist the architect/engineer in evaluating the structure's potential performance.

Concrete with a specified compressive strength of 10,000 psi (70 MPa) can be produced from local aggregates in all areas of the U.S. and Canada. When the specified strength substantially exceeds that produced previously in a particular market area, special measures are necessary to make a successful progression to the use of the higher-strength concrete. This guide details those measures.

Because the definition of HSC has changed over the years, ACI Committee 363 defined a range of concrete strengths for its activities, as explained in ACI 363R. For the purpose of this guide, HSC is defined as having a specified compressive strength of 8000 psi (55 MPa) or greater, and it does not include polymer-impregnated concrete, epoxy concrete, or concrete made with artificial normalweight and heavyweight aggregates. Changes in material properties, production and inspection techniques, or testing methods occur continuously from lower-strength to higher-strength concretes. Experience shows that in most cases, the special measures recommended in this guide should be applied for concrete with compressive strength greater than approximately 8000 psi (55 MPa).

## CHAPTER 2—NOTATION AND DEFINITIONS

### 2.1—Notation

$f'_c$  = specified compressive strength of concrete, psi (MPa)

### 2.2—Definitions

ACI provides a comprehensive list of definitions through an online resource, "ACI Concrete Terminology," at <http://terminology.concrete.org>. Definitions provided herein complement that resource.

**concrete, high-strength (HSC)**—concrete that has a specified compressive strength of 8000 psi (55 MPa) or greater.

**quality assurance (QA)**—actions taken by an organization to provide and document assurance that what is being done and what is being provided are in accordance with the contract documents and standards of good practice for the work.

**quality control (QC)**—actions taken by an organization to provide control and documentation over what is being done and what is being provided so that the applicable standard of good practice and the contract documents for the work are followed.

**self-consolidating concrete (SCC)**—is highly flowable, nonsegregating concrete that can spread into place, fill the formwork, and encapsulate the reinforcement without any mechanical consolidation. In general, SCC is concrete made with conventional concrete materials and, in some cases, with a viscosity-modifying admixture (VMA). SCC has also been described as self-compacting concrete, self-placing concrete, and self-leveling concrete, which all are subsets of SCC.

**water-cementitious material ratio ( $w/cm$ )**—the ratio of the mass of water, excluding that absorbed by the aggregate, to the mass of cementitious material in a mixture, stated as a decimal.
