†Subcommittee Chair.

This guide describes the technology and applications of fiber-reinforced shotcrete (FRS) using synthetic and steel fibers. Mechanical properties, particularly toughness, impact, and flexural strength, are improved by fiber addition, and these improvements are described along with other typical properties and benefits, such as control of shrinkage cracking. Proportions of typical mixtures, batching, mixing, and application procedures are described, including methods of reducing rebound and equipment used to apply FRS. Applications of FRS are described, including rock-slope stabilization work, construction and repair of tunnel and mining linings, fire explosive spalling-resistant linings, channel linings, pools and rockscapes, and structure repair. Available design information is briefly discussed, and design references are listed.

Keywords: fiber-reinforced shotcrete; fibers; linings; mining; repair; steel fibers; synthetic fibers; tunnels.

CONTENTS

Chapter 1—Introduction and scope, p. 506.1R-2
1.1—Introduction
1.2—Scope
1.3—Historical background

Chapter 2—Notation and definitions, p. 506.1R-2
2.1—Notation
2.2—Definitions

Chapter 3—Materials, p. 506.1R-2
3.1—General
3.2—Fibers
3.3—Other materials

Chapter 4—Mixture proportions, p. 506.1R-3
4.1—General
4.2—Wet-process
4.3—Dry-process

ACI Committee Reports, Guides, Manuals, Standard Practices, and Commentaries are intended for guidance in planning, designing, executing, and inspecting construction. This document is intended for the use of individuals who are competent to evaluate the significance and limitations of its content and recommendations and who will accept responsibility for the application of the material it contains. The American Concrete Institute disclaims any and all responsibility for the stated principles. The Institute shall not be liable for any loss or damage arising therefrom.

Reference to this document shall not be made in contract documents. If items found in this document are desired by the Architect/Engineer to be a part of the contract documents, they shall be restated in mandatory language for incorporation by the Architect/Engineer.

1.3—Historical background

FRS with steel fibers was first placed in North America early in 1971 in experimental work directed by Lankard, et al. (1971). Steel FRS (SFRS) was proposed for underground support by Parker in 1971 (Parker 1974). Additional trials were made by Poa in an investigation of new and improved methods of using shotcrete for underground support (Poa et al. 1975). Subsequently, the first practical applications of SFRS were made in a tunnel adit at Ririe Dam, ID in 1973 (Kaden 1977). Since that time, SFRS has been used throughout the world. Shotcrete using micropolypropylene fibers was first placed in Europe in 1968 (Hannant 1978). Macrosynthetic fibers for use in shotcrete were developed in the mid-1990s and have been used in mining and slope stabilization projects (Morgan and Heere 2000).

2.2—Definitions

aspect ratio, fiber—the ratio of length to diameter of a fiber in which the diameter may be an equivalent diameter.
denier—measure of fiber diameter, taken as the mass in grams of 9000 m (29,528 ft) of the fiber.
equivalent diameter, fiber—diameter of a circle with an area equal to the cross-sectional area of the fiber.
macrofiber—a fiber with an equivalent diameter greater than or equal to 0.012 in. (0.3 mm) for use in concrete.
microfiber—a fiber with an equivalent diameter less than 0.012 in. (0.3 mm) for use in concrete.

3.1—General

FRS is conventional shotcrete with fibers added. Materials for use in FRS should conform to the requirements of ASTM C1436, which covers the typical materials used in shotcrete, including chemical and mineral admixtures, fibers, and the combined grading of aggregates for fine and coarse mixtures: Grading No. 1: No. 4 to No. 100 sieve (4.75 mm to 150 μm), and No. 2: 3/8 in. to No. 100 sieve (9.5 mm to 150 μm).
