infrastructures en béton

Introduction: *The versatility of shotcrete*

Research problem

Objectives

Methods

Results and discussion

Conclusion

Retaining walls

Structural shotcrete Ltd., Vancouver, 2016

Structural columns

Introduction: *Factors affecting encapsulation*

Research problem

Objectives

Methods

Results and discussion

Conclusion

Encapsulation of reinforcing bars

Equipment

⇒ Condition

Spraying technique

- ⇒ Distance between nozzleman and surface
- ⇒ Air flow velocity

Mixture properties

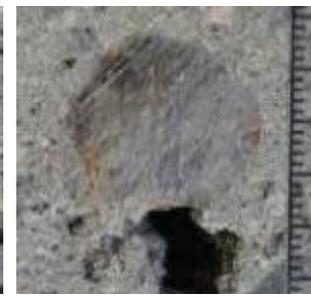

- ⇒ Accelerators
- ⇒ Mineral admixtures
- ⇒ Consistency

Structural layout

- ⇒ Number of bar layers
- ⇒ Bar position
- ⇒ Overhead vs. sidewall
- ⇒ Lap splices

Perfect encapsulation

Voids of variable geometry and position

Introduction: *Types of shotcrete process*

Research problem

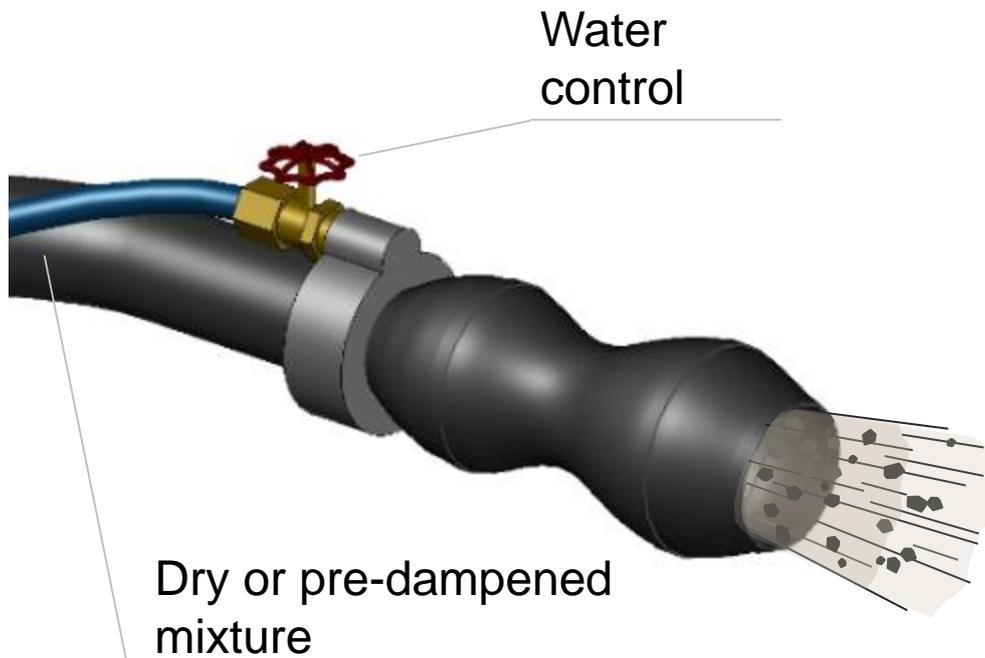

Objectives

Methods

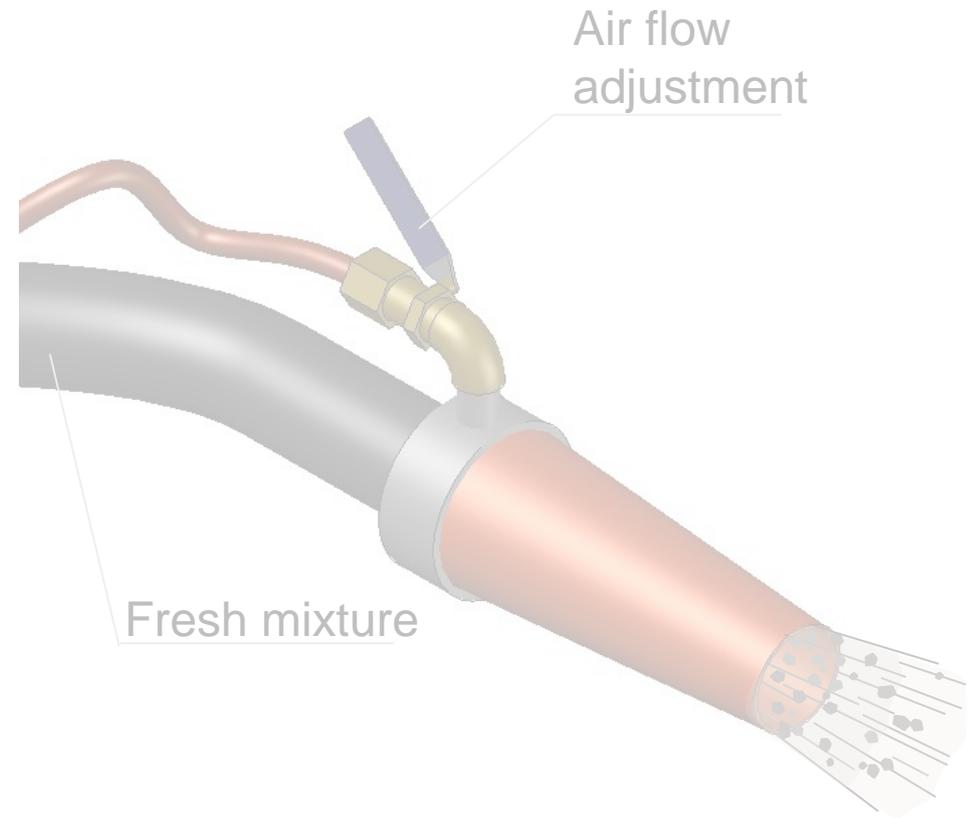

Results and discussion

Conclusion

DRY-MIX

WET-MIX

Introduction: *Dry-mix adjustment before spraying*

Research problem

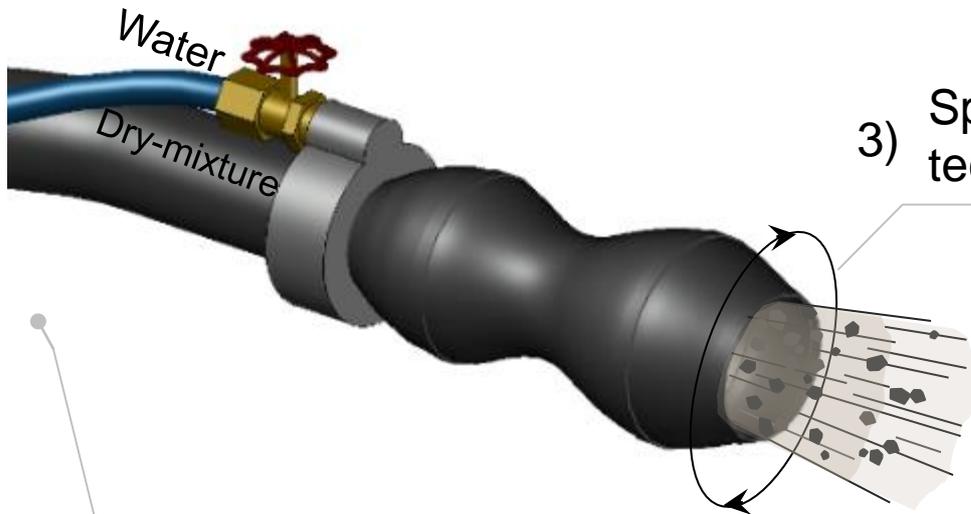

Objectives

Methods

Results and discussion

Conclusion

2) Water control

3) Spraying technique

1) Air flow specification

Dry-mix process
Water adjustment

Dry-mix process
Water adjustment

Introduction: *The bond mechanism*

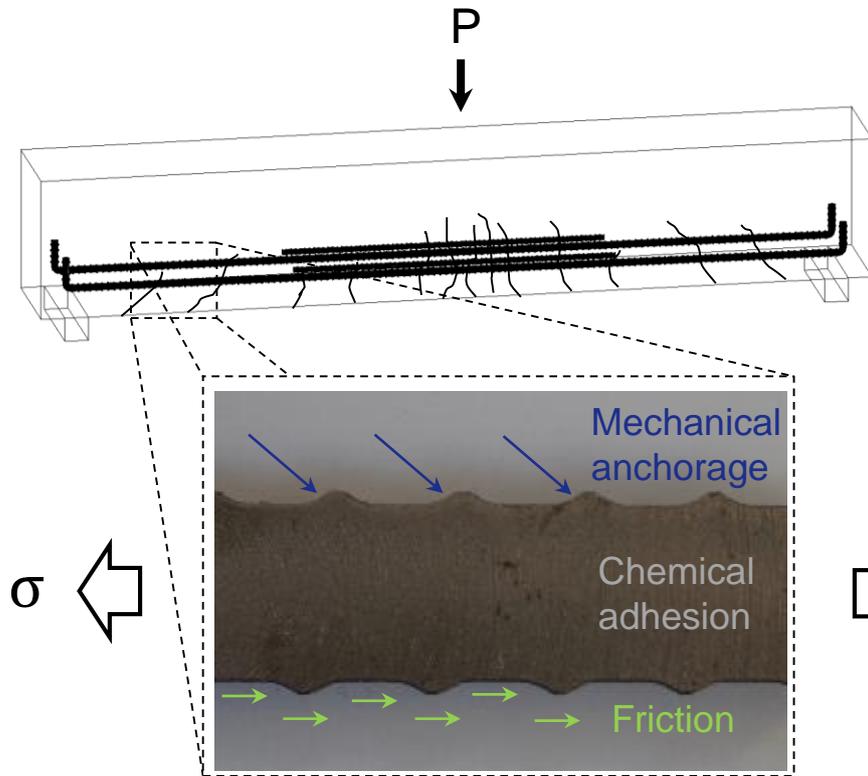

Research problem

Objectives

Methods

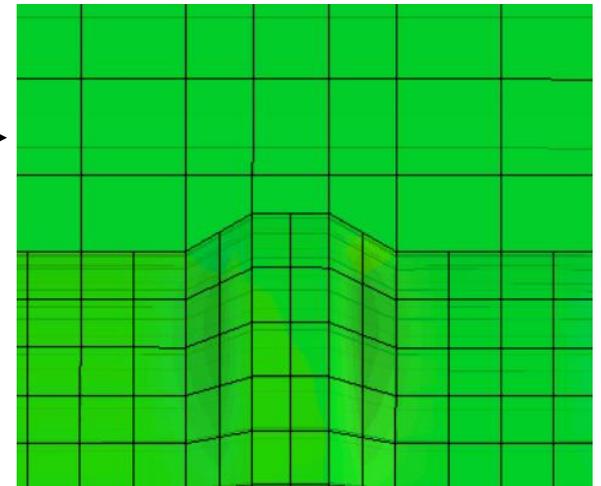

Results and discussion

Conclusion

Concrete →

Bar →

Relative slip

→ $E_s/E_c \approx 6 - 8$

→ Micro-cracking

Naturally, bond will be reduced if voids behind bars are created !

Research problem: *Acceptance criteria*

Introduction

Objectives

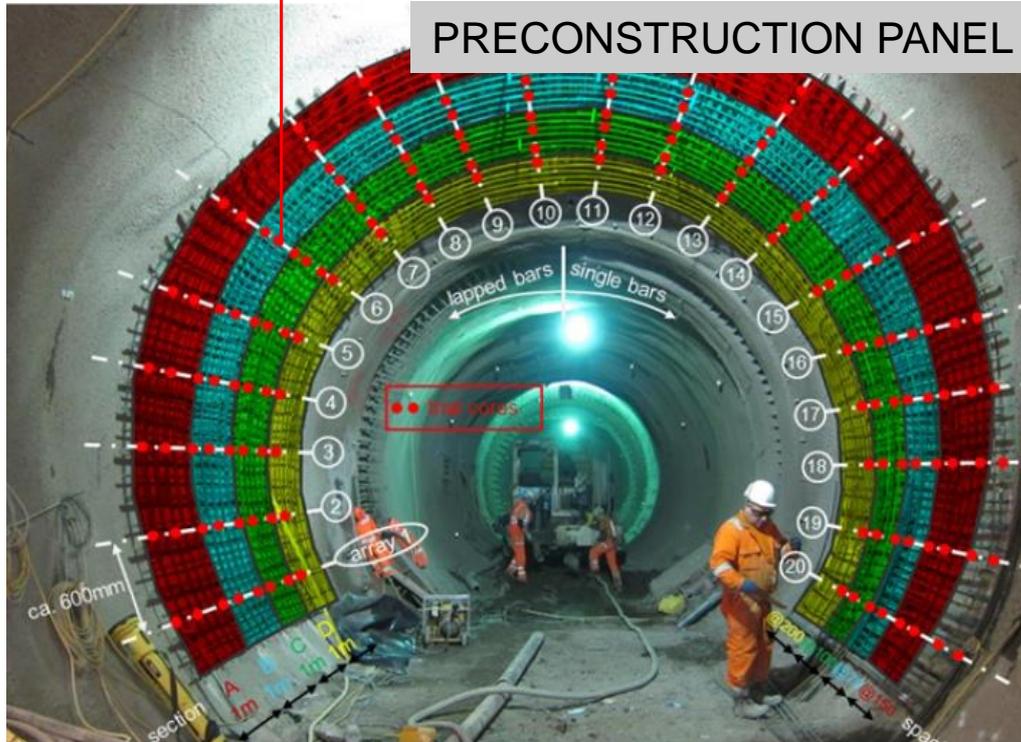

Methods

Results and discussion

Conclusion

PRECONSTRUCTION PANEL

Fischer M. et al., Crossrail learning legacy, 2015

Before

ACI 506.2-95

≡ Core grade evaluation from 1 to 5

ACI 506.2-13

≡ Removal of the core grade system
(only intended for C660 certification)

Now

≡ Quality assessment based on
experience
(no correlation with bond reduction)

≡ Inadequate factors applied (if any)
for bar splices and development
lengths

Objectives

Introduction

Research problem

Methods

Results and discussion

Conclusion

Study bond strength reduction caused by voids

Design

*BOND IN CONCRETE
PART 2 OF 3*

*Monday 27th March
1:30 p.m.*

Inspection

Concerning bond strength

Methods: *Dry-mix pull-out specimens*

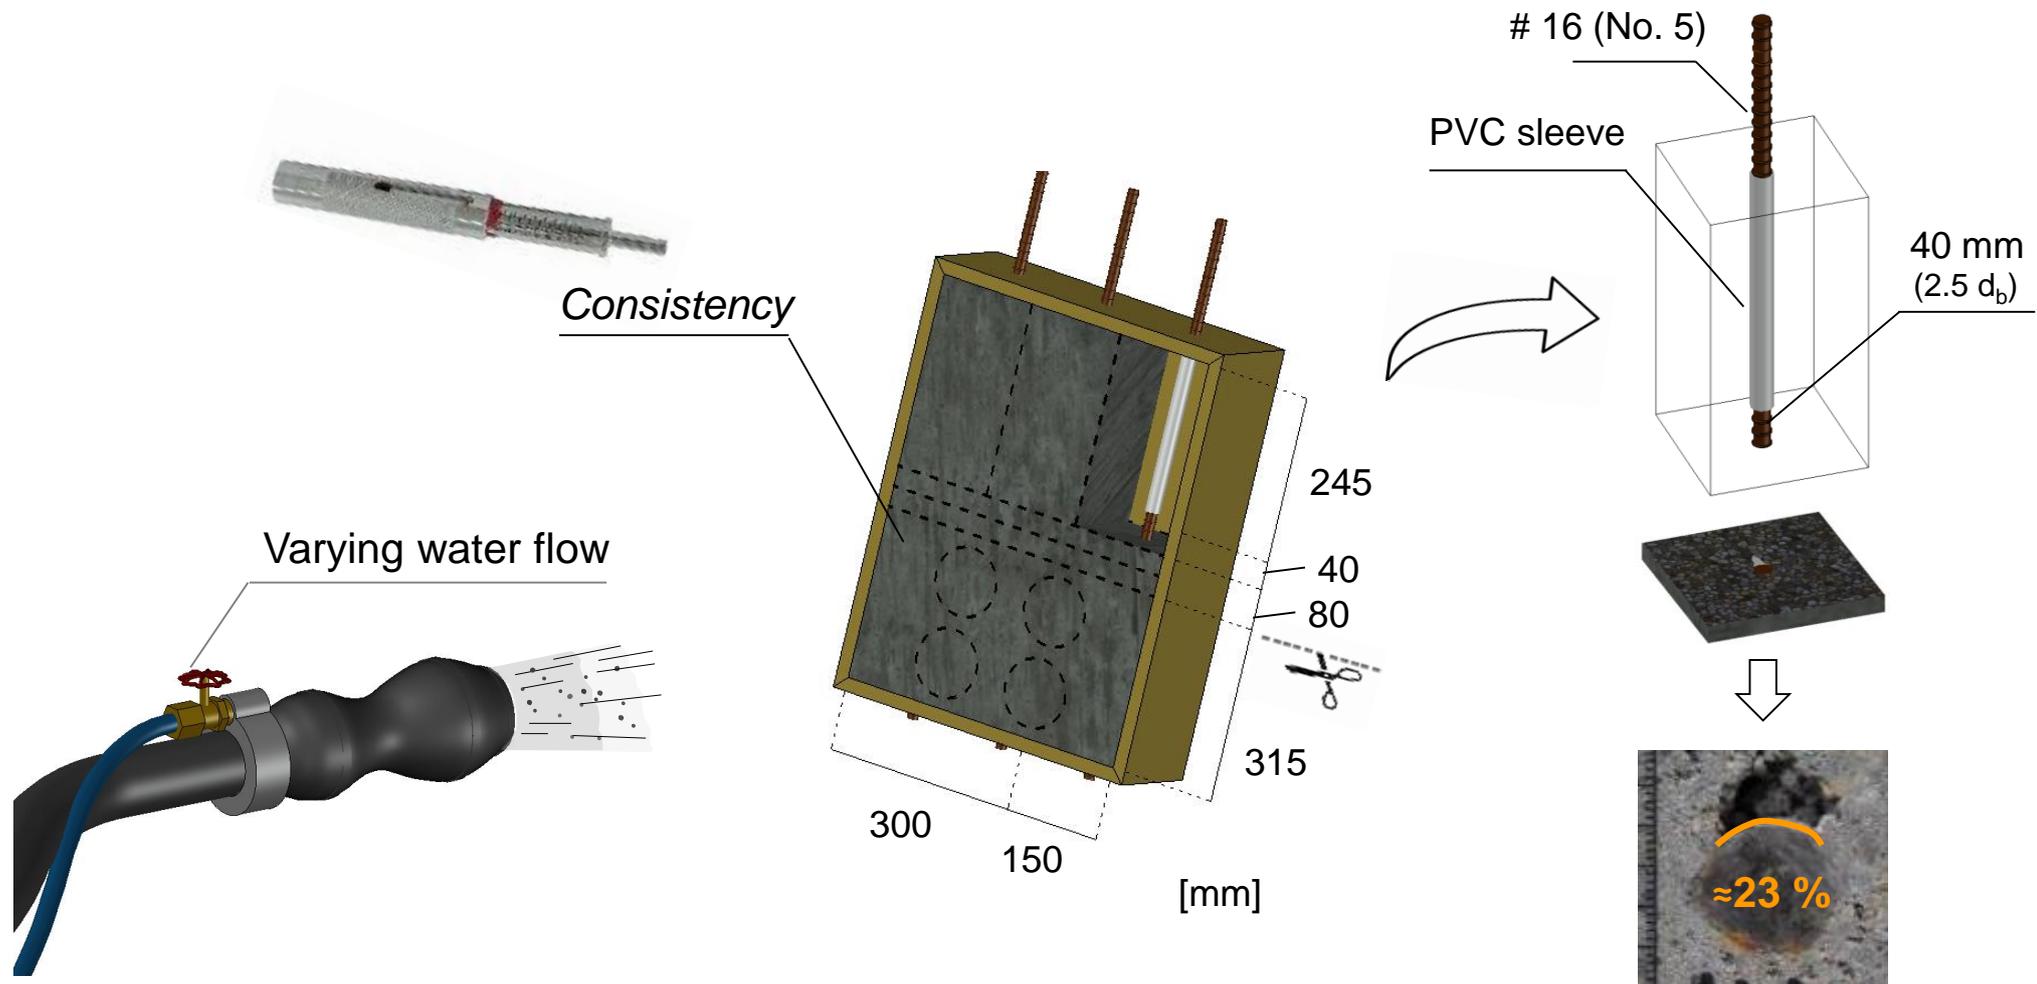

Introduction

Research problem

Objectives

Results and discussion

Conclusion

un-bonded perimeter, u.p.

Methods: *Dry-mix pull-out specimens*

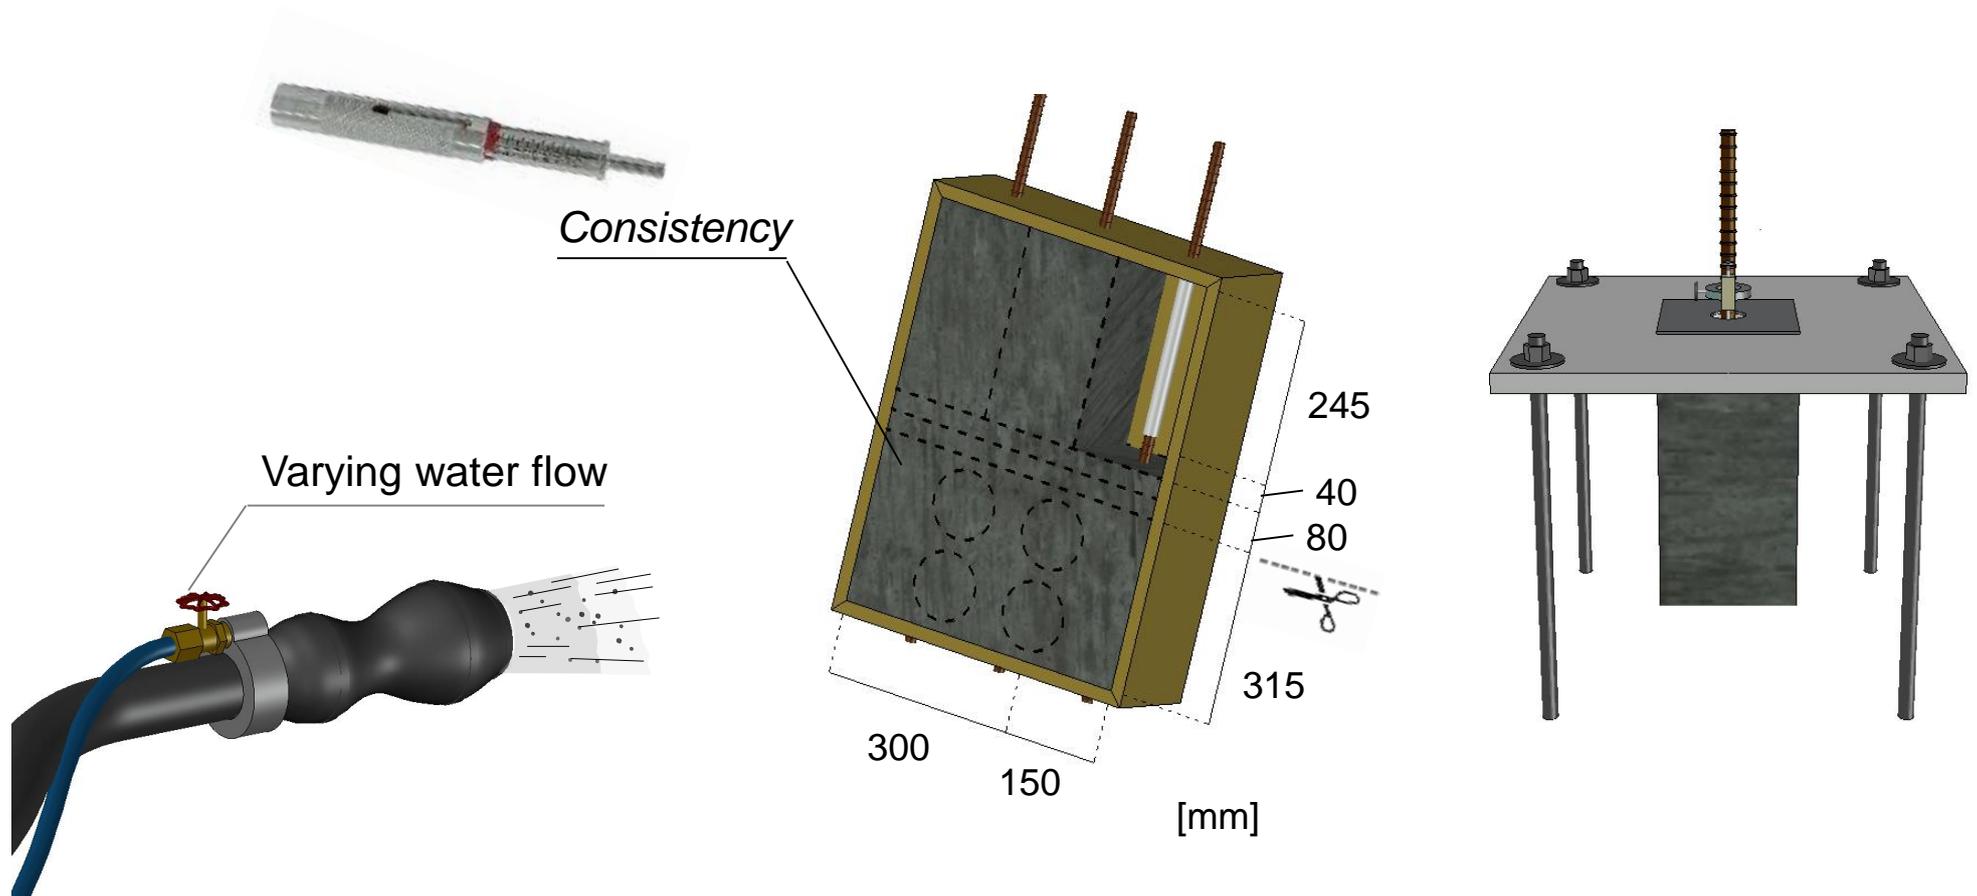

Introduction

Research problem

Objectives

Results and discussion

Conclusion

EFFECT OF *CONSISTENCY*

Results and discussion

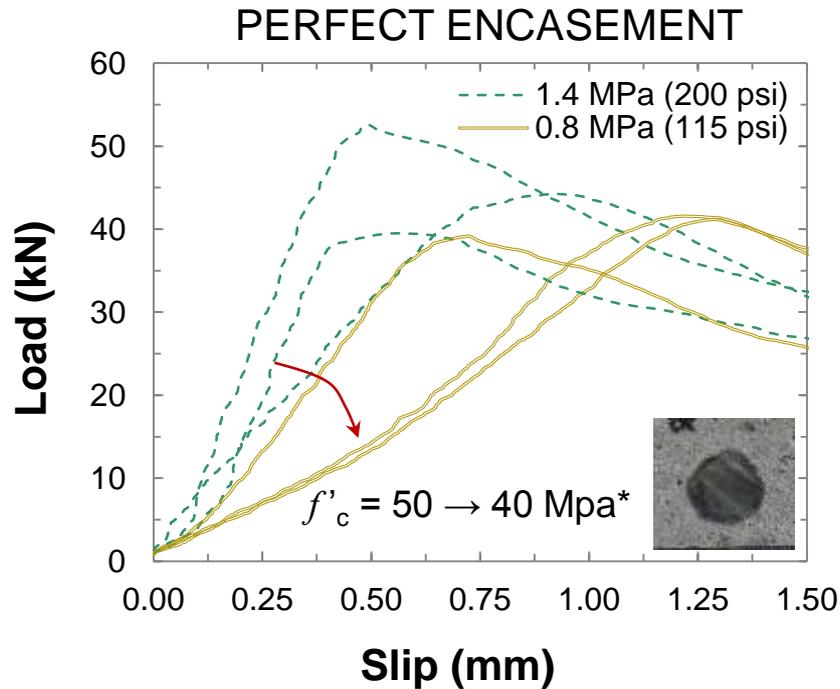

Introduction

Research problem

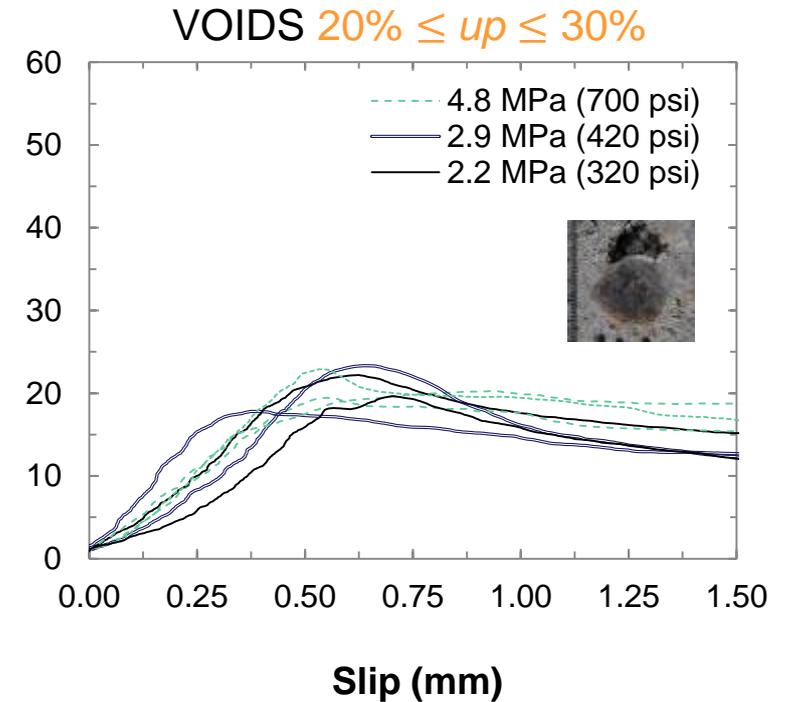

Objectives

Methods

Conclusion

- ≡ • Statistically same maximal load
- ≡ • Increased slip because of weaker concrete around the bar

- ≡ • Statistically same maximal loads
- ≡ • Reduction of $\approx 50\%$ of the maximal load

EFFECT OF
UN-BONDED PERIMETER

Results and discussion

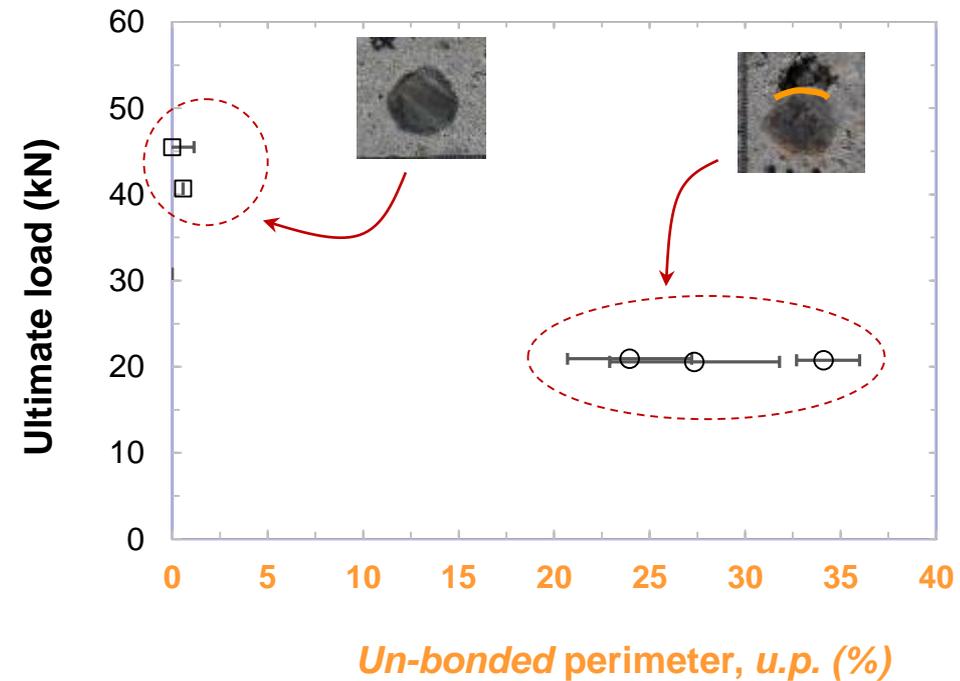

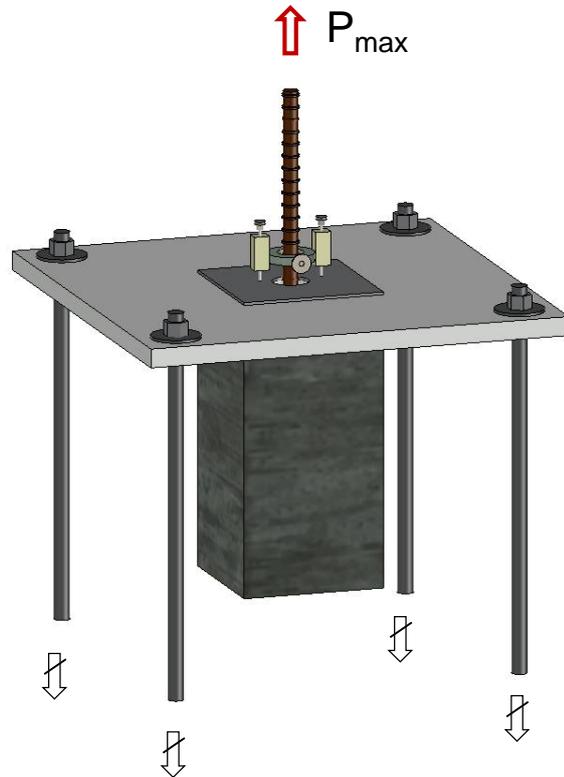

Introduction

Research problem

Objectives

Methods

Conclusion

- Unable to create voids between **5 to 20 % u.p.**
- Difficult to assess variation of **u.p.**
- \approx 50% of bond strength reduction

HOW DO WE BETTER CONTROL VOID SIZES?

THE ANSWER LIES ON:

CIP + ***ARTIFICIAL VOIDS***

Results and discussion

Introduction

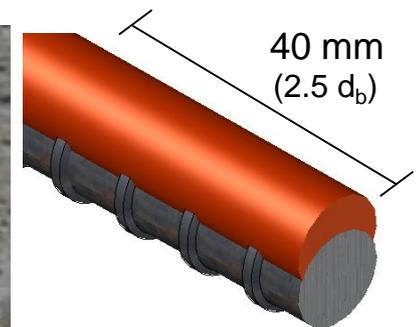

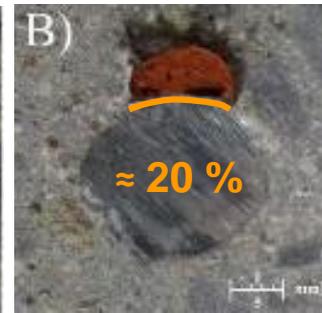

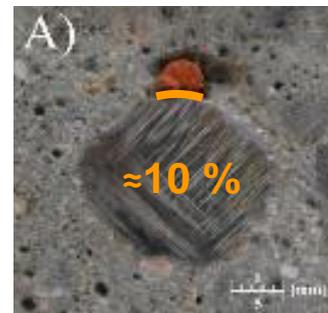

Research problem

Objectives

Methods

Conclusion

HOW DO WE BETTER CONTROL VOID SIZES?: **CIP** + **ARTIFICIAL VOIDS**

Poured shotcrete mixture with MRWR

Better manoeuvrability

$w/b = 0.45$

$D_{\max} = 10 \text{ mm}$

8% Silica fume

Results and discussion

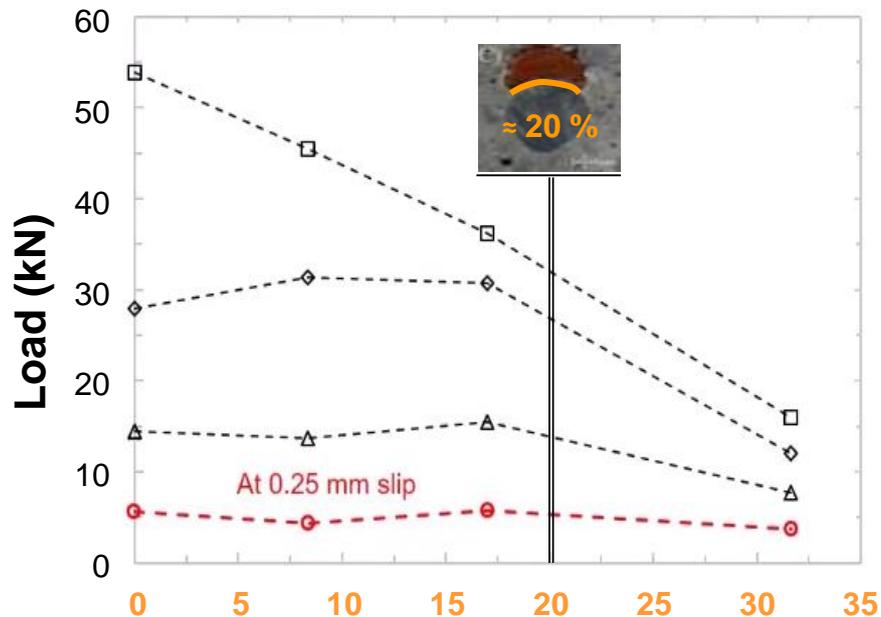

Introduction

Research problem

Objectives

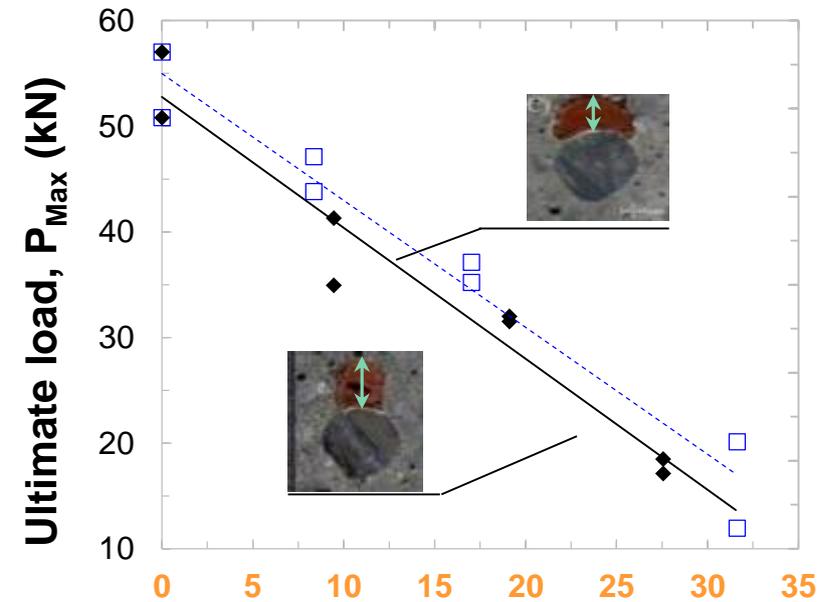

Methods

Conclusion

Un-bonded perimeter, u.p. (%)

- ⇒ Critical *u.p.* threshold of approximately 20% at service loads
- ⇒ Gradual reduction at ultimate load

Un-bonded perimeter, u.p. (%)

- ⇒ Statistically same slope and intercept
- ⇒ The height does not influence bond strength reduction

Results and discussion

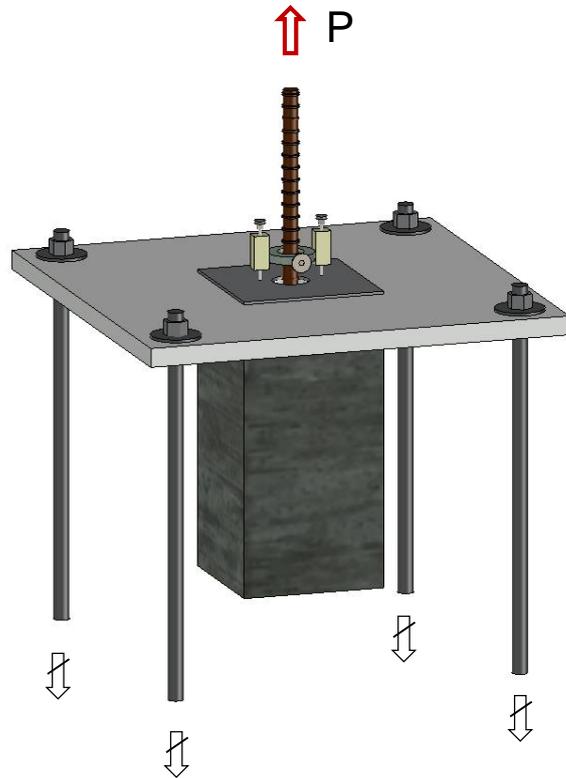

Introduction

Research problem

Objectives

Methods

Conclusion

VS.

Do *artificial voids* accurately represent voids created with shotcrete ?

Results and discussion

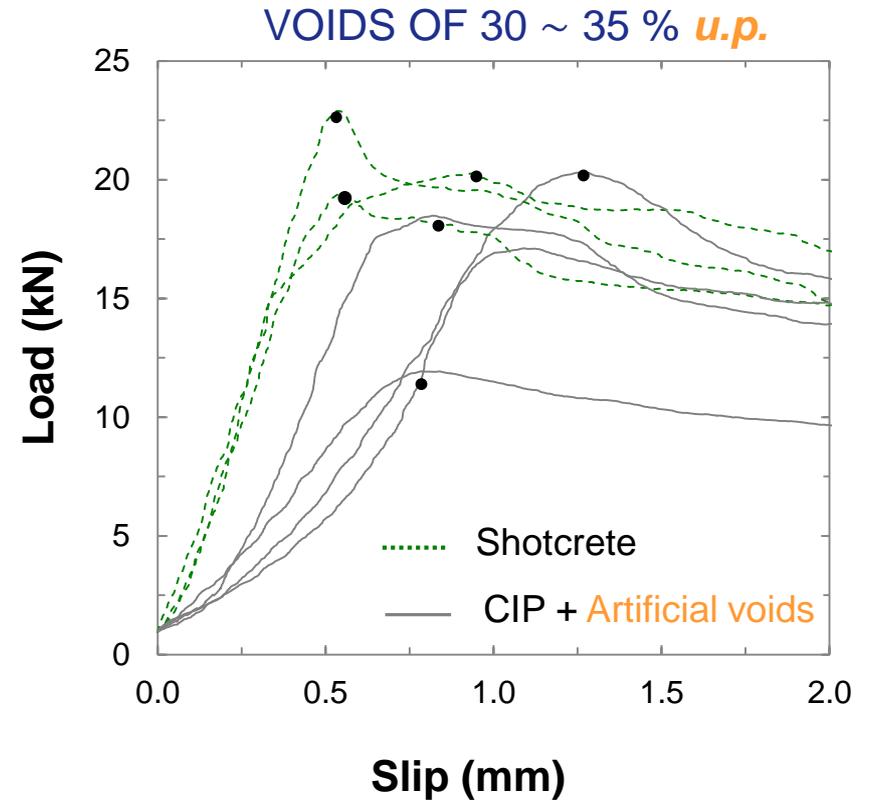

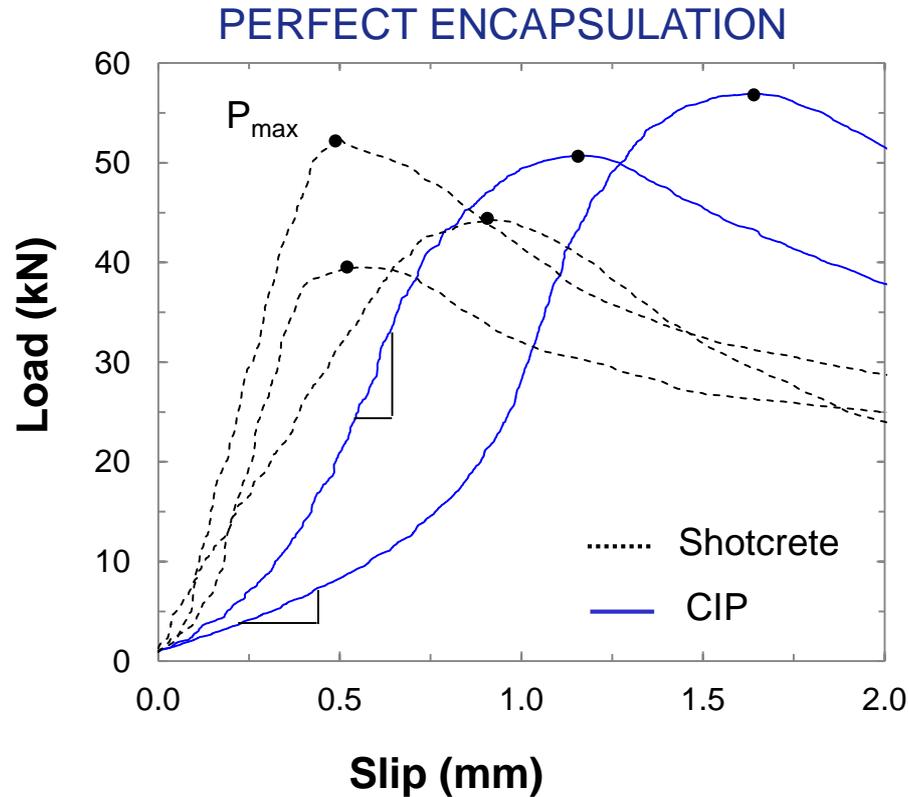

Introduction

Research problem

Objectives

Methods

Conclusion

$$H_0: \mu_c = \mu_{BP}$$

vs.

$$H_a: \mu_c \neq \mu_{BP}$$

P_{max} are equal for both methods of concrete placement

Results and discussion

Introduction

Research problem

Objectives

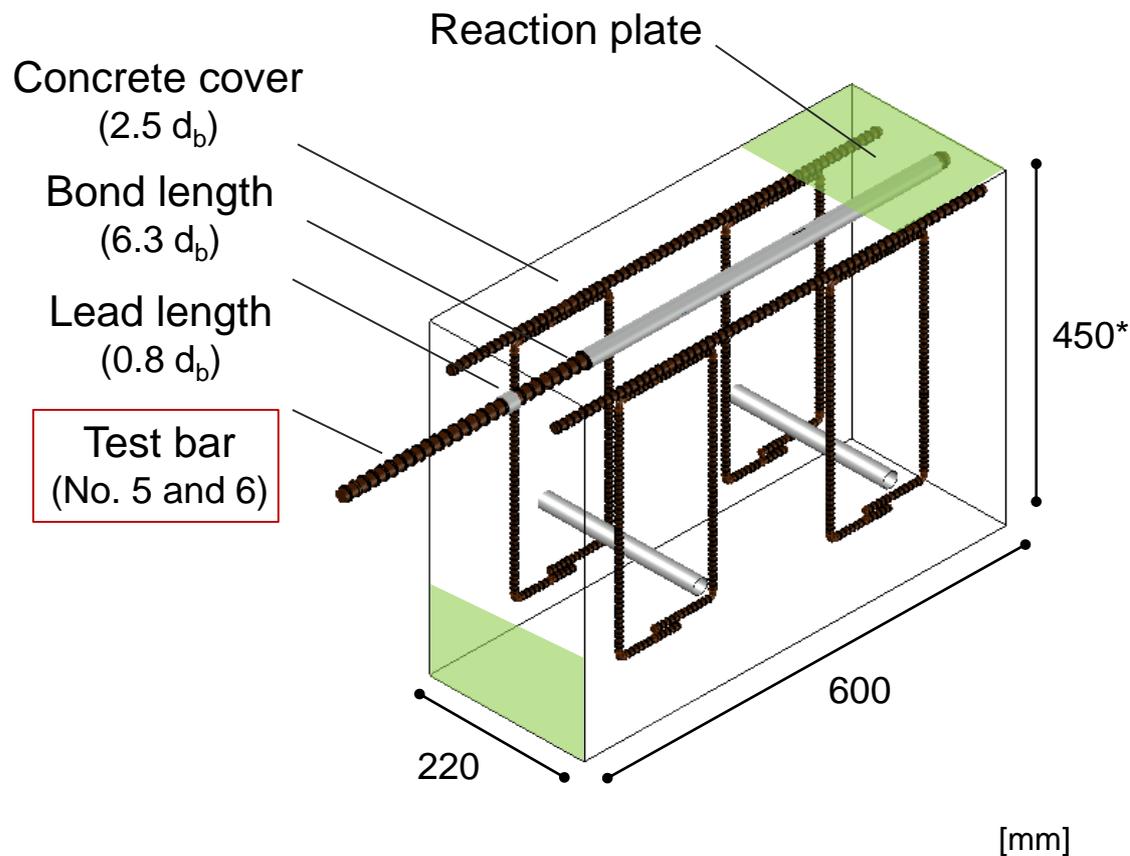

Methods

Conclusion

What is the next step?: Bonded lengths seen in structures

SPECIMENS: ASTM A944-10

TEST SET-UP

*1 inch = 25.4 mm

Results and discussion

Introduction

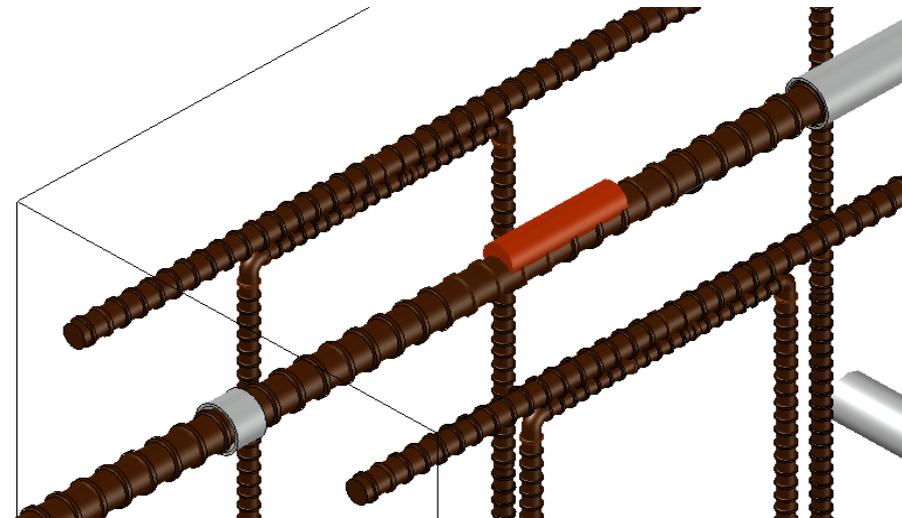

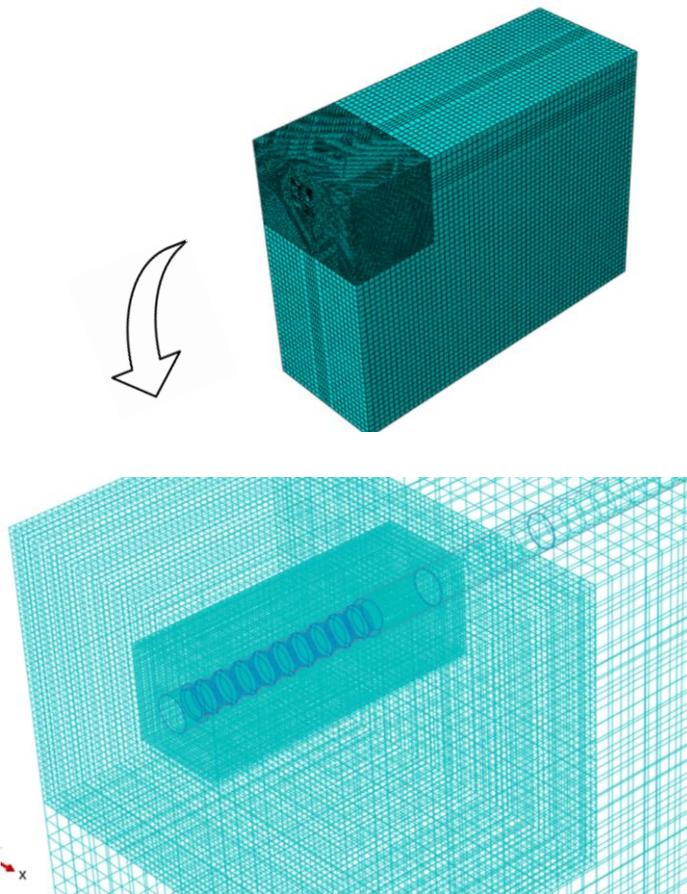

Research problem

Objectives

Methods

Conclusion

What is the next step?: Bonded lengths seen in structures

- ≡ • Impact of localized voids on bond reduction
- = • Stress redistribution

Conclusion

Introduction

Research problem

Objectives

Methods

Results and discussion

- ⇒ • High compaction caused by shooting creates better bar-concrete interface in comparison with regular CIP concrete
- ⇒ • Low *consistencies* (≤ 1.4 Mpa) may cause « good » encapsulation but slip is enlarged
- ⇒ • Threshold of **$\approx 20\%$ u.p.**
 - = • Drastic reduction at 0.25 mm slip
 - = • $\approx 50\%$ bond reduction at ultimate load
- ⇒ • The height of voids do no influence significantly bond strength reduction

*HELP DEVELOP NEW
ACCEPTANCE CRITERIA*

Conclusion

Introduction

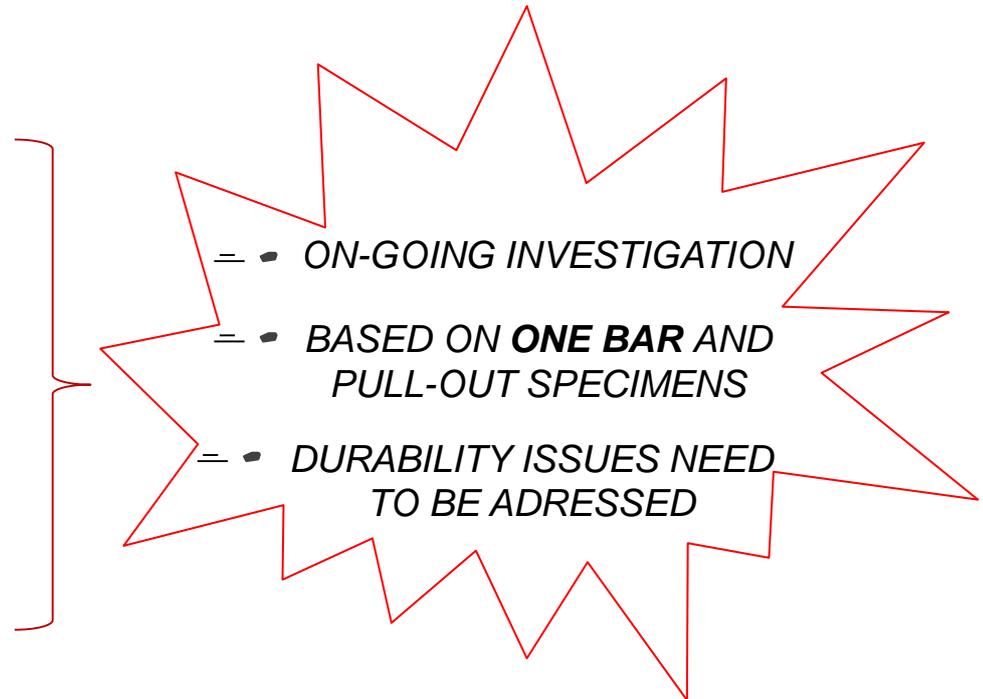

Research problem

Objectives

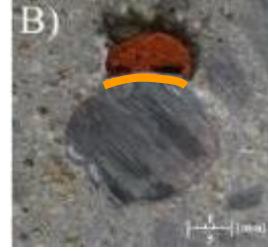

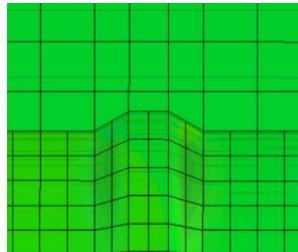

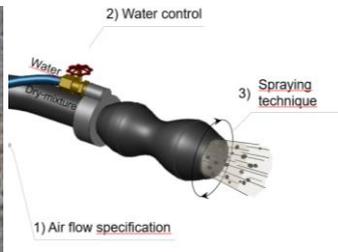

Methods

Results and discussion

- ⇒ • High compaction caused by shooting creates better bar-concrete interface in comparison with regular CIP concrete
- ⇒ • Low *consistencies* (≤ 1.4 Mpa) may cause « good » encapsulation but slip is enlarged
- ⇒ • Threshold of $\approx 20\%$ *u.p.*
 - = • Drastic reduction at 0.25 mm slip
 - = • $\approx 50\%$ bond reduction at ultimate load
- ⇒ • The height of voids do no influence significantly bond strength reduction
