

Live Load on Concrete Bridge Decks

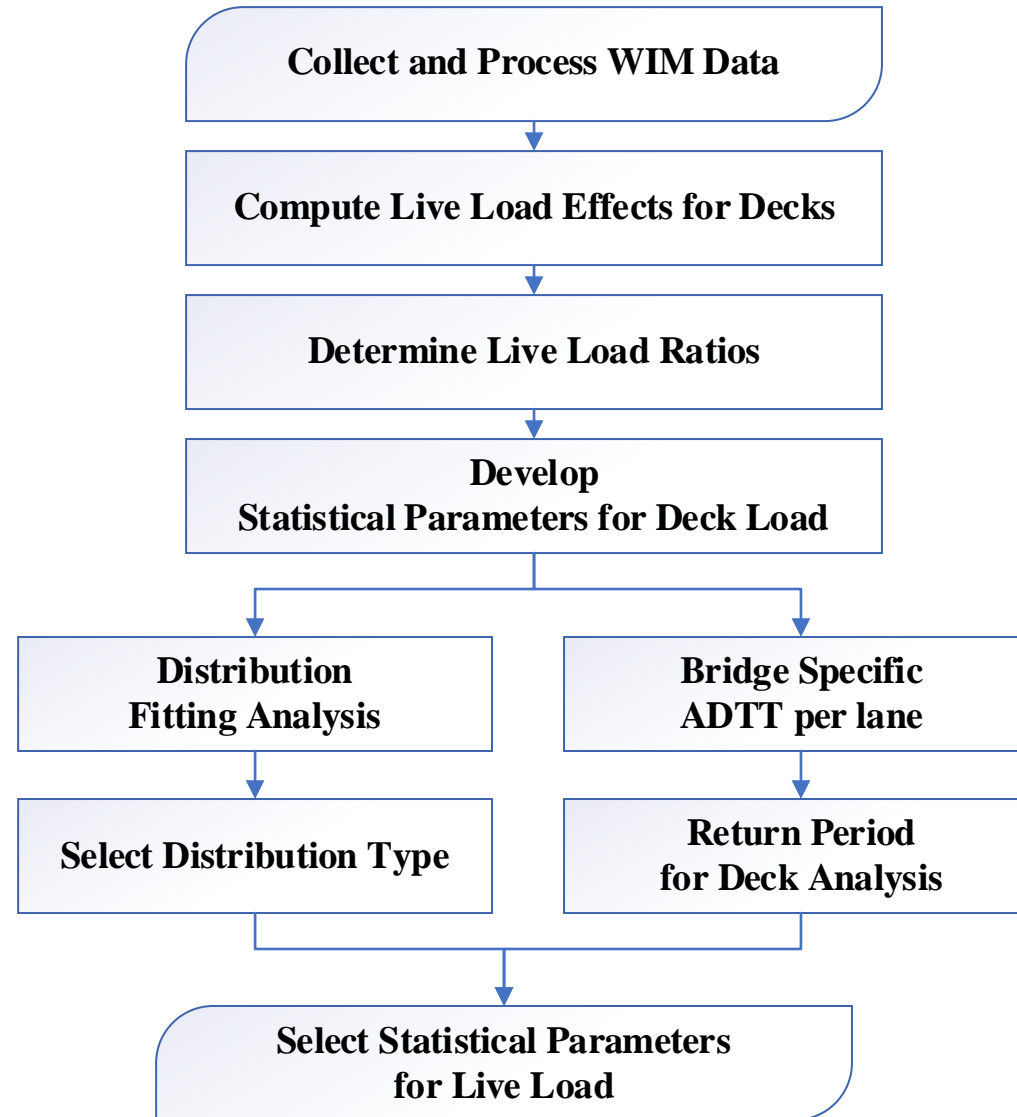

Sylwia Stawska
Jacek Chmielewski
Andrzej S. Nowak

PROBLEM STATEMENT

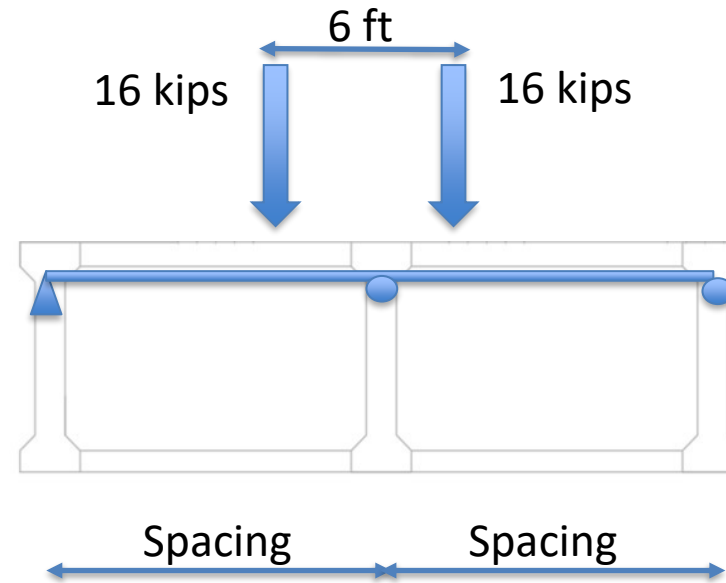

- Rapid bridge deck deterioration.
- Increased heavy traffic.
- Design loads were not calibrated for decks.
- Need for live load model verification.
- Wheel load available in Weigh-in-Motion database.
- Live load factors needed for bridge decks.

- Calculations of transverse live load effects.
- Traffic extrapolation.
- Statistical distribution fitting.
- Service life of a deck.
- Development of live load statistical parameters.
- Calibration of live load factor.

DEVELOPMENT OF DECK LIVE MODEL

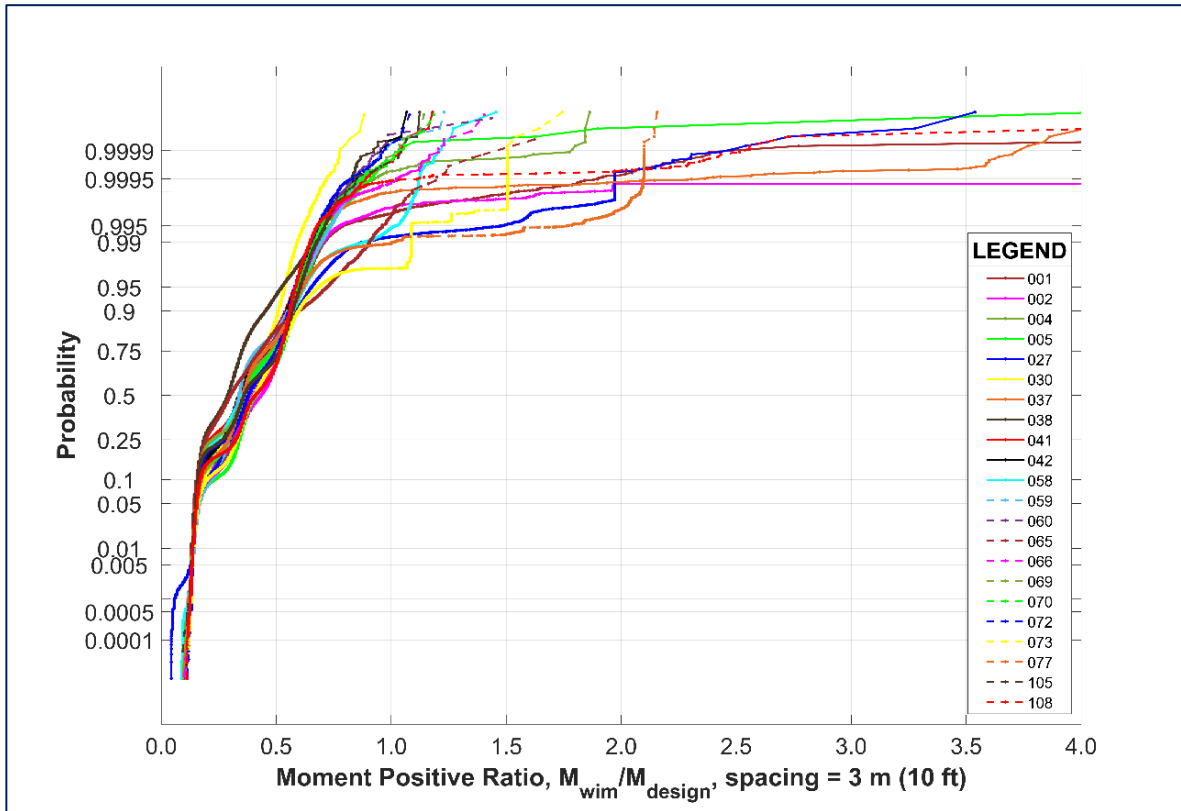

TRANSVERSE LIVE LOAD EFFECTS

- California WIM have wheel load data.
- Maximum axle load was taken for every WIM truck.
- Analysis was performed for two continuous span model.
- Maximum moment and shear were found using influence lines.

TRANSVERSE LIVE LOAD RATIOS

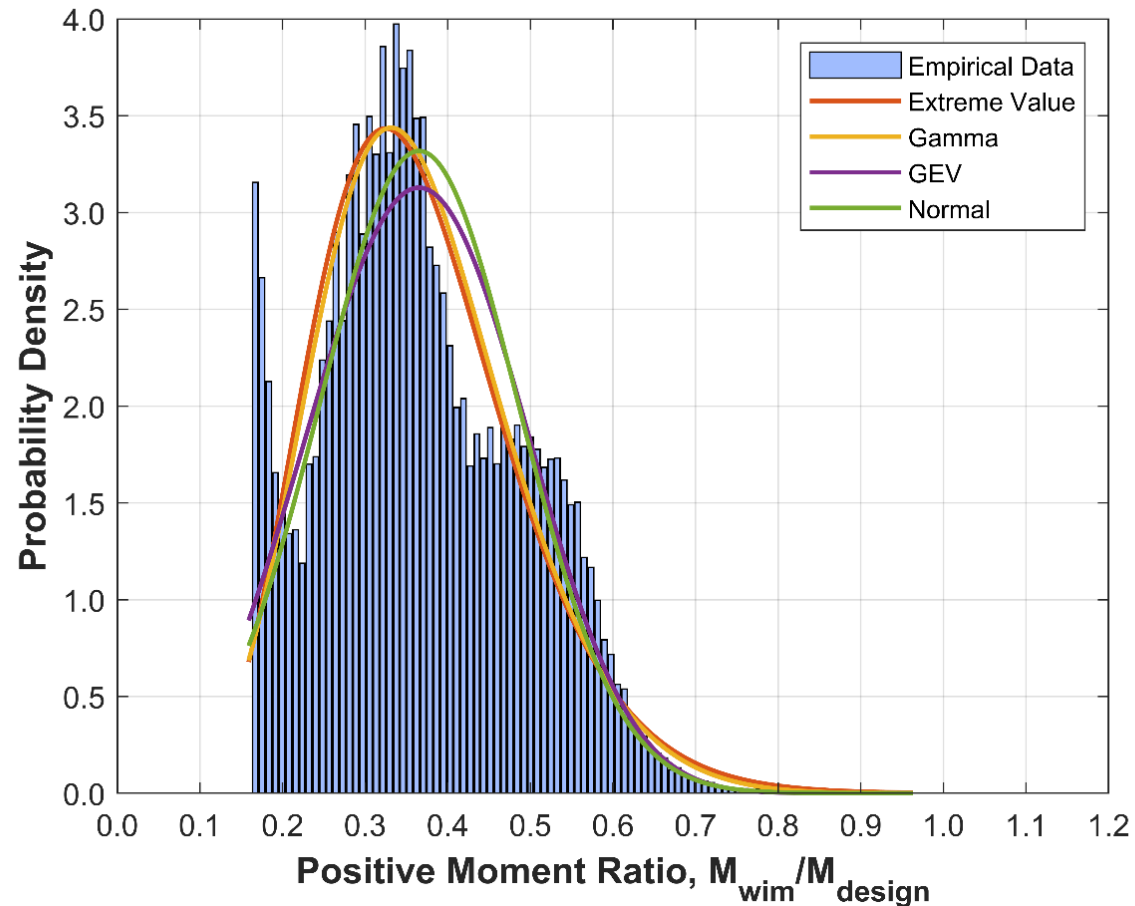

LIVE LOAD EXTRAPOLATION

- Prediction of the expected maximum live load for a specific time (return) period and traffic volume.
- N = expected number of trucks in time (T days) and traffic volume (ADTT):

$$N = \text{Return Period (days)} \cdot \text{Traffic Volume (ADTT)}$$

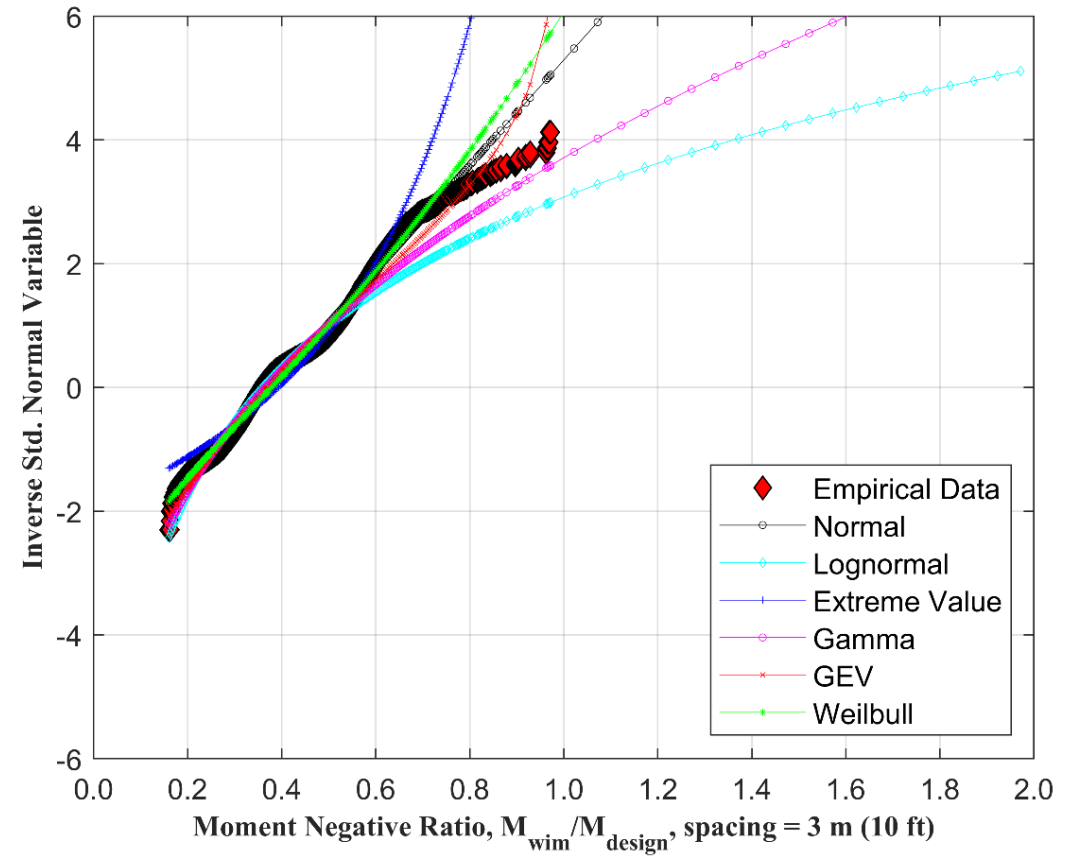

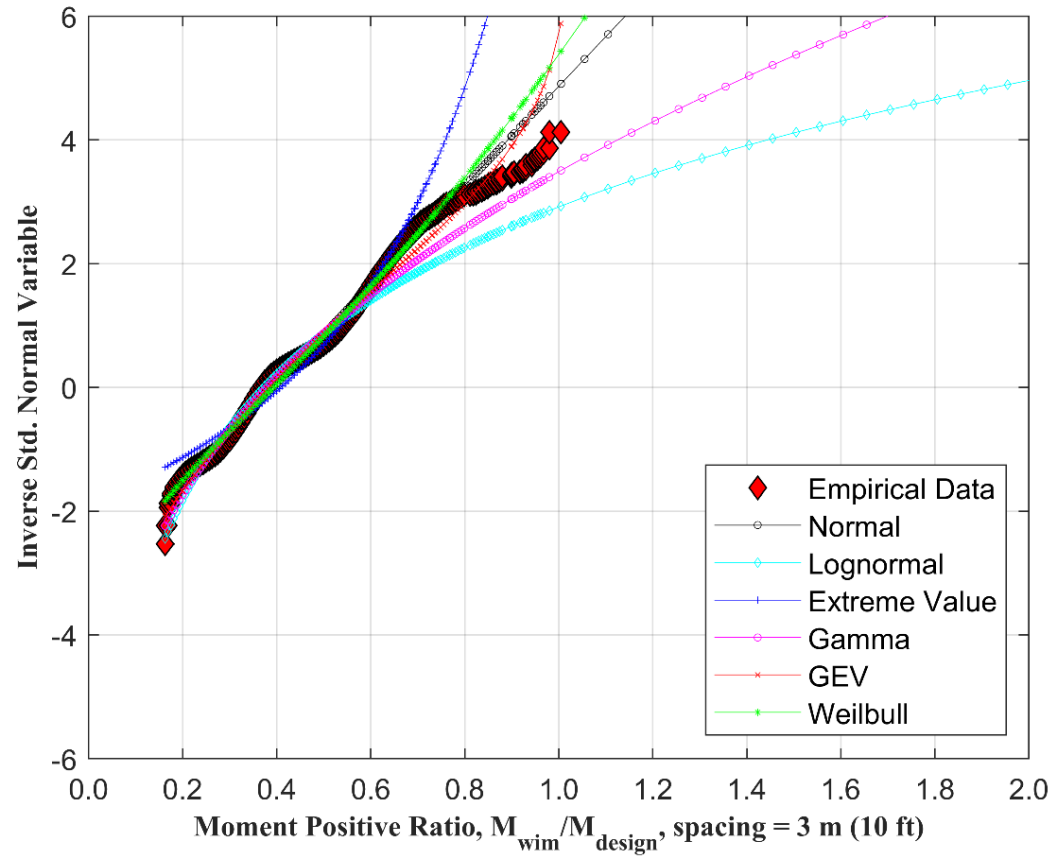

- $1/N$ = probability of exceeding the maximum WIM-based live load.

FITTING DISTRIBUTION

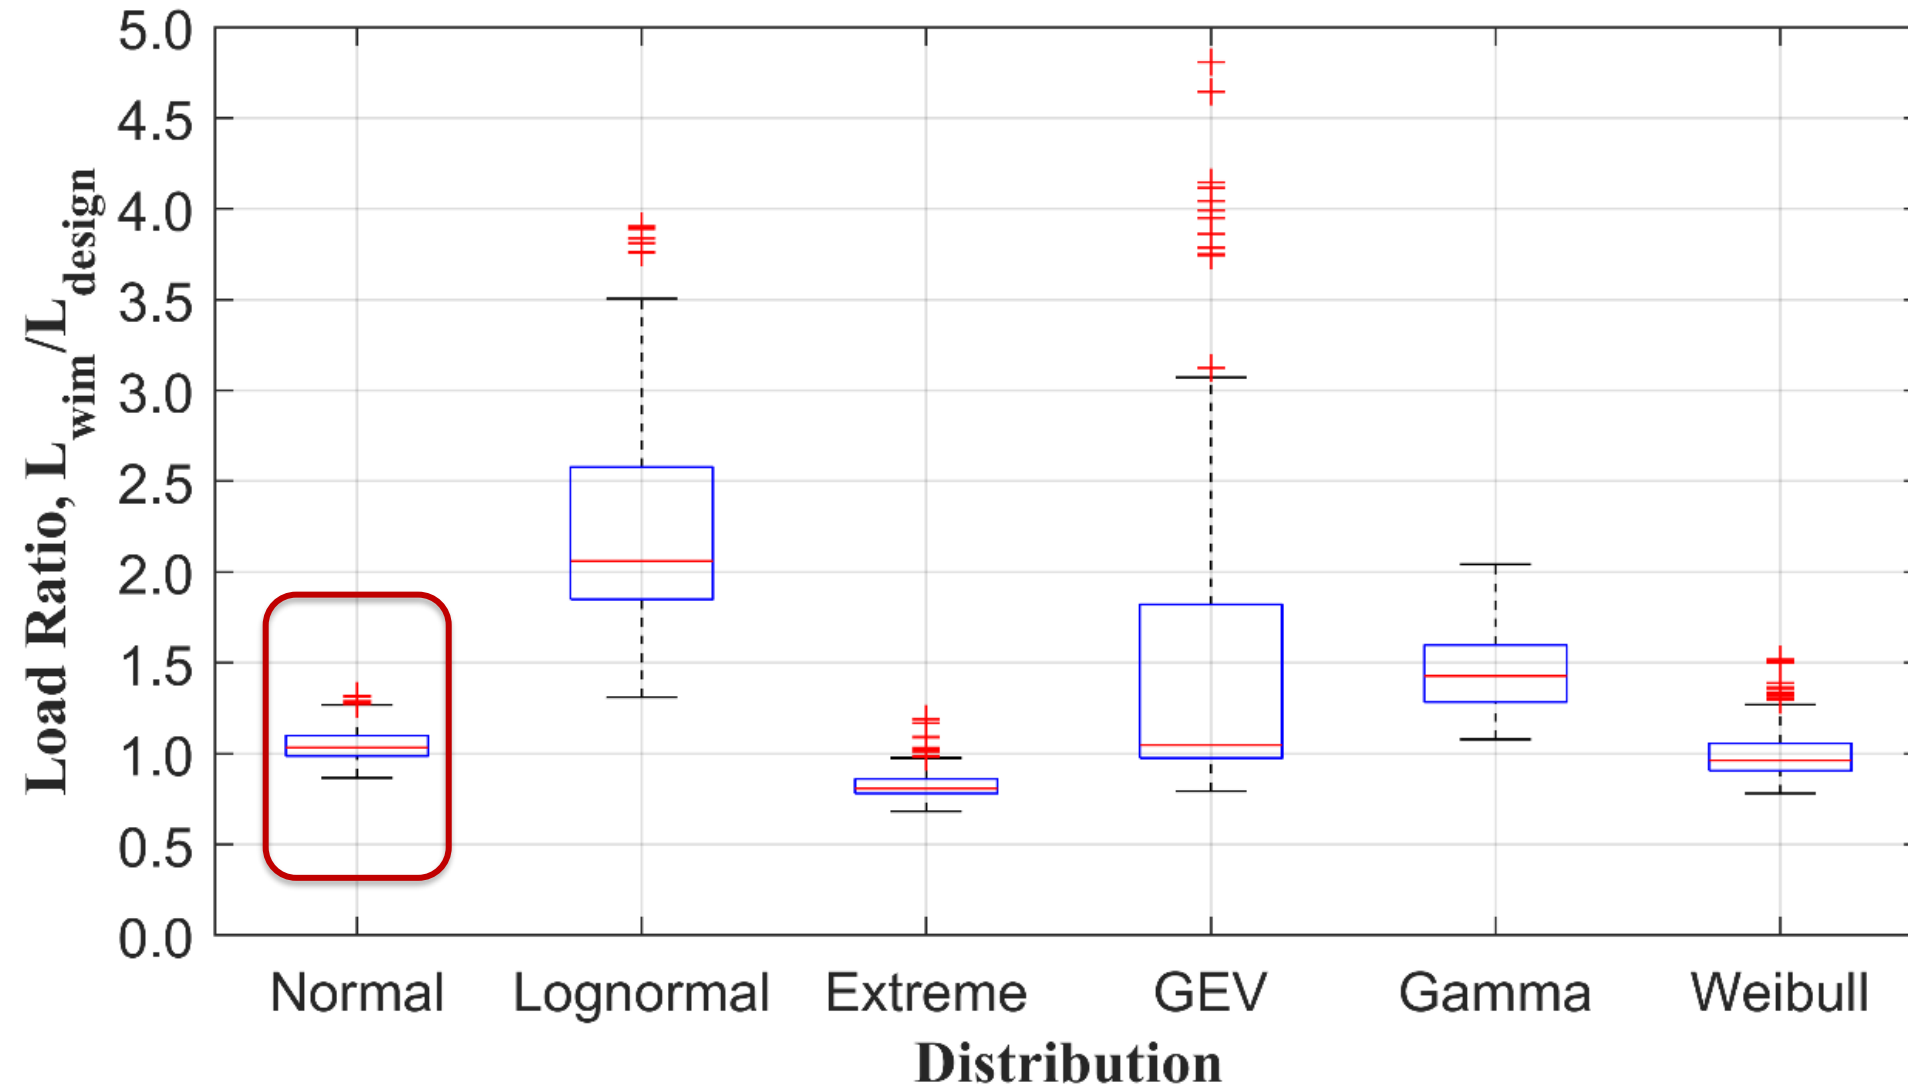

- Best fit was conducted for the following distributions: Beta, Exponential, Extreme Value, Gamma, Generalized Extreme Value (GEV), Generalized Pareto, Inverse Gaussian, Logistic, Loglogistic, Lognormal, Nakagami, Normal, Rayleigh, Rician, Weibull.
- The fitting procedure was applied to every WIM site and a wide range of spacings.

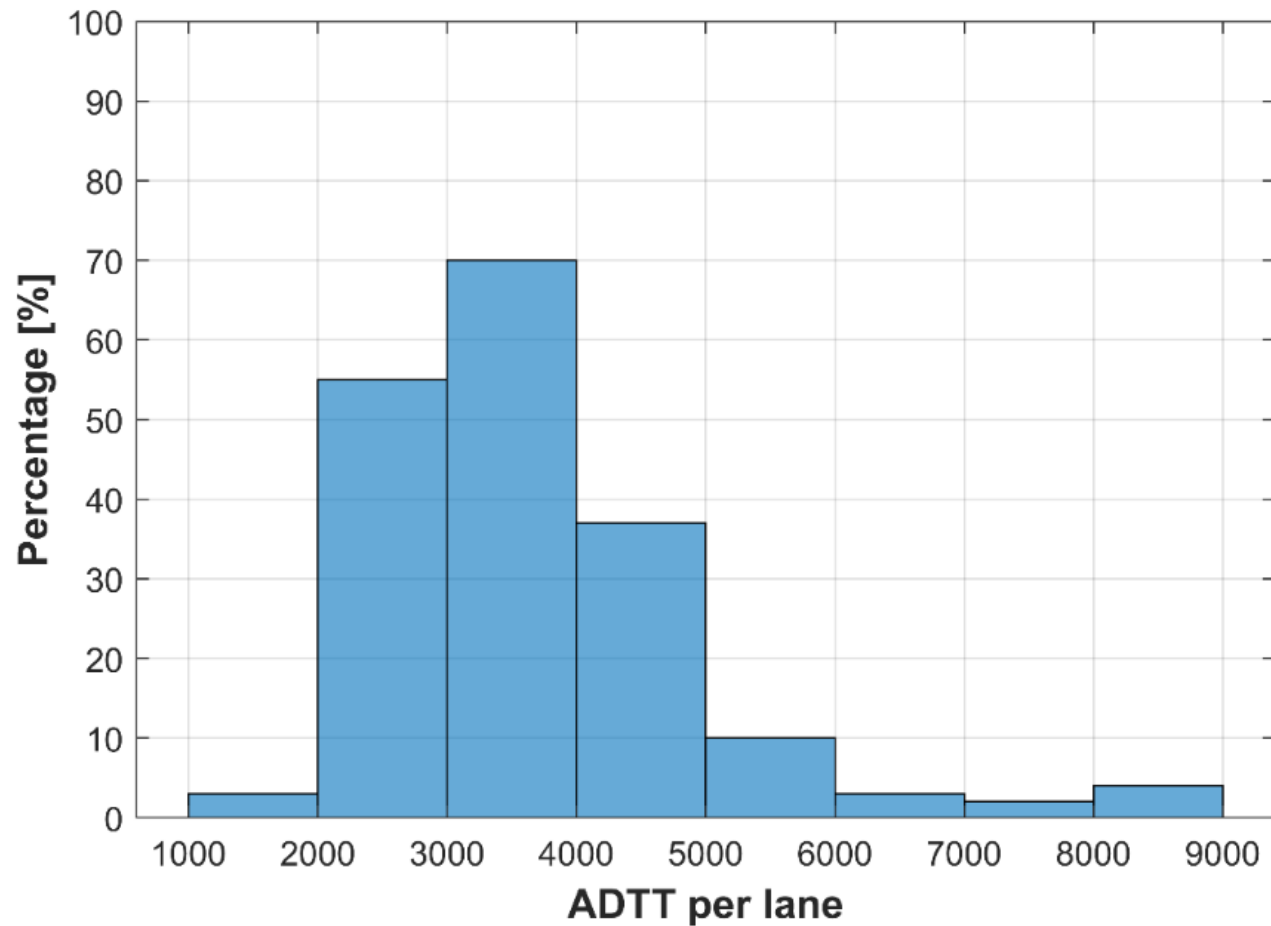

FITTING FOR CALIFORNIA TRAFFIC

FITTED DISTRIBUTIONS

AVERAGE DAILY TRUCK TRAFFIC PER LANE IN CALIFORNIA

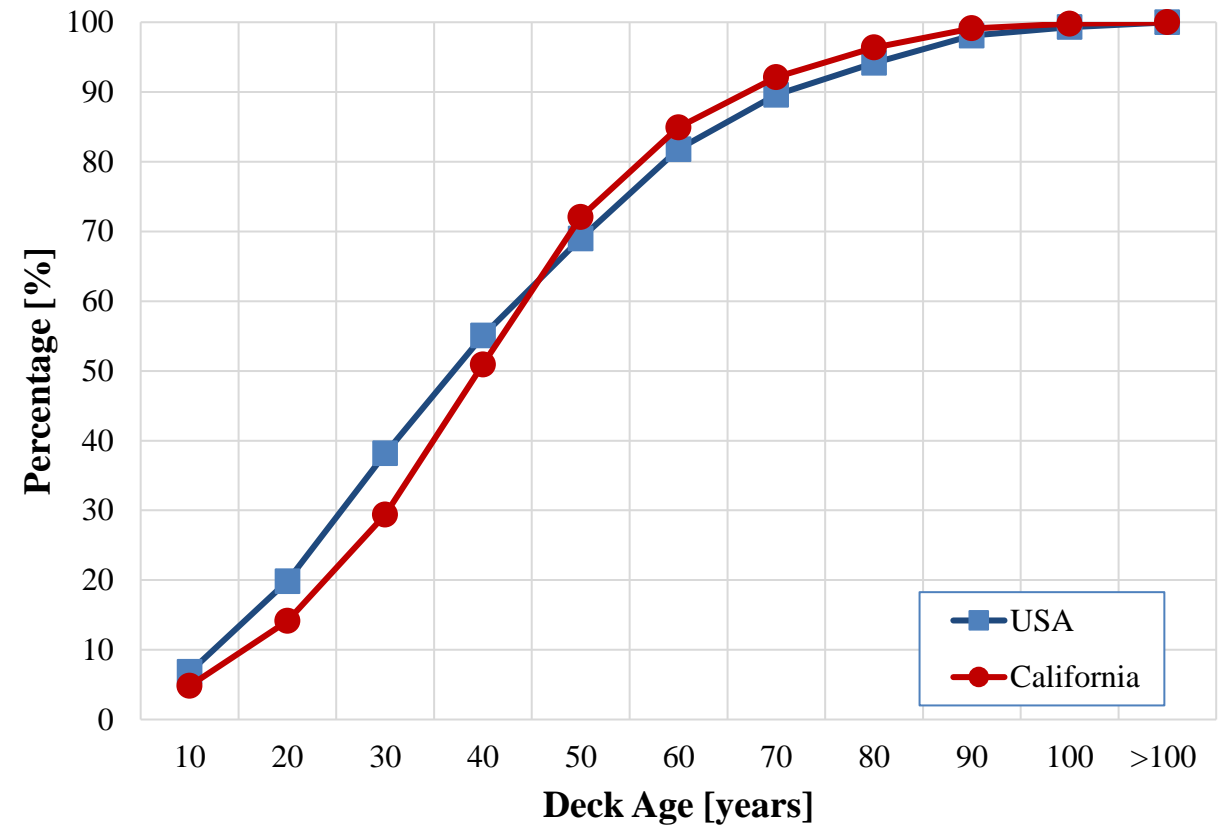

■ Selected ADTT (trucks/day/lane):

- 1,000
- 2,000
- 3,000
- 4,000
- 5,000
- 6,000

SERVICE LIFE OF DECK AND RETURN PERIOD

- Service life of a bridge is specified as 75 years in AASHTO.
- Service life of a deck has not been specified.
- In practice, it varies considerably.

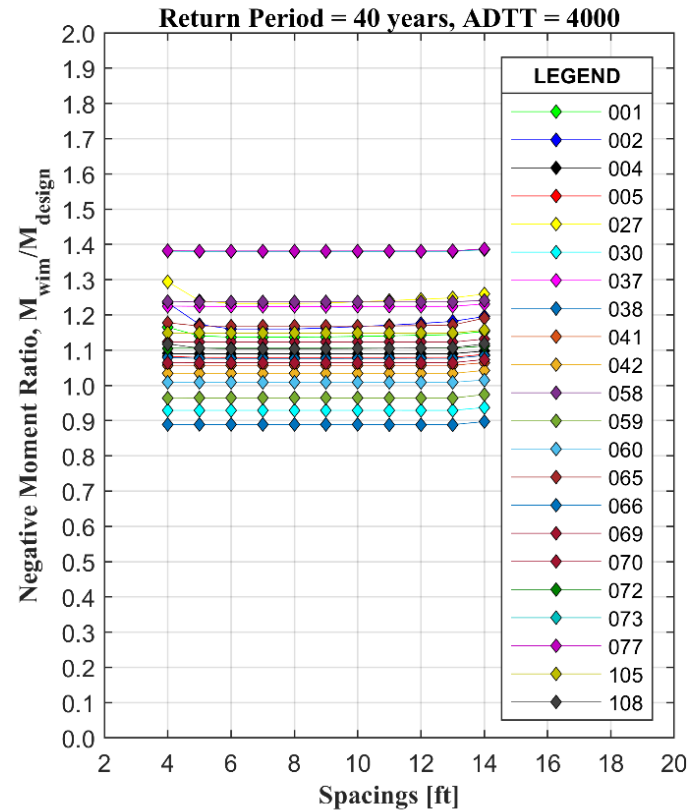

- Deck age at the first major maintenance activity is as shown (InfoBridge, 1983-2020).
- The following return periods were considered:
 - 10 years
 - 20 years
 - 30 years
 - 40 years
 - 50 years

Coefficient of variation 11-13%

For 40 years return period

CONCLUSIONS

- Big traffic live load including wheel load is available to develop deck live load model.
- Transverse live load analysis for California traffic was considered.
- Bias factor is 1.18-1.35.
- Coefficient of variation is 11-13%.
- Recommended statistical parameters for California loads are:
 - **Bias factor 1.25.**
 - **Coefficient of variation of 12%.**
- Developed statistical models can serve as a basis for reliability-based calibration of live load factor for concrete decks.
