ACI 131 Committee Overview

ACI 131 – Building Information Modeling of Concrete Structures:

- Organized 2009 – Fall Convention in New Orleans

Current Membership:

- 17 Voting Members (many initial members still active)
- 21 Associate Members, 7 Consulting Members

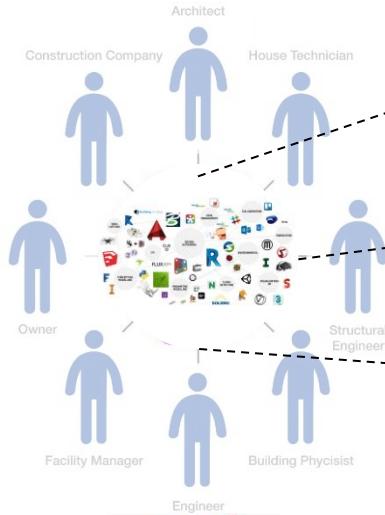

Mission:

- Develop and report information on the application of Building Information Modeling (BIM) to concrete structures.

ACI 131 Committee Overview

Industry Foundation Classes (IFC): Open standard to define and represent building objects, processes, relationships and other data. (ISO 16739)

Steel

Precast Concrete

Cast-in-Place Concrete

- **Complex Supply Chain:**
 - Design** (Arch, Struct, Detail)
 - Supply** (Rebar, Concrete, Finish)
 - Temporary** (Form, Scaffold, Shoring)
 - Build** (GC, Trades)
- **Complex Modeling:** Monolithic vs. Object-Oriented Modeling

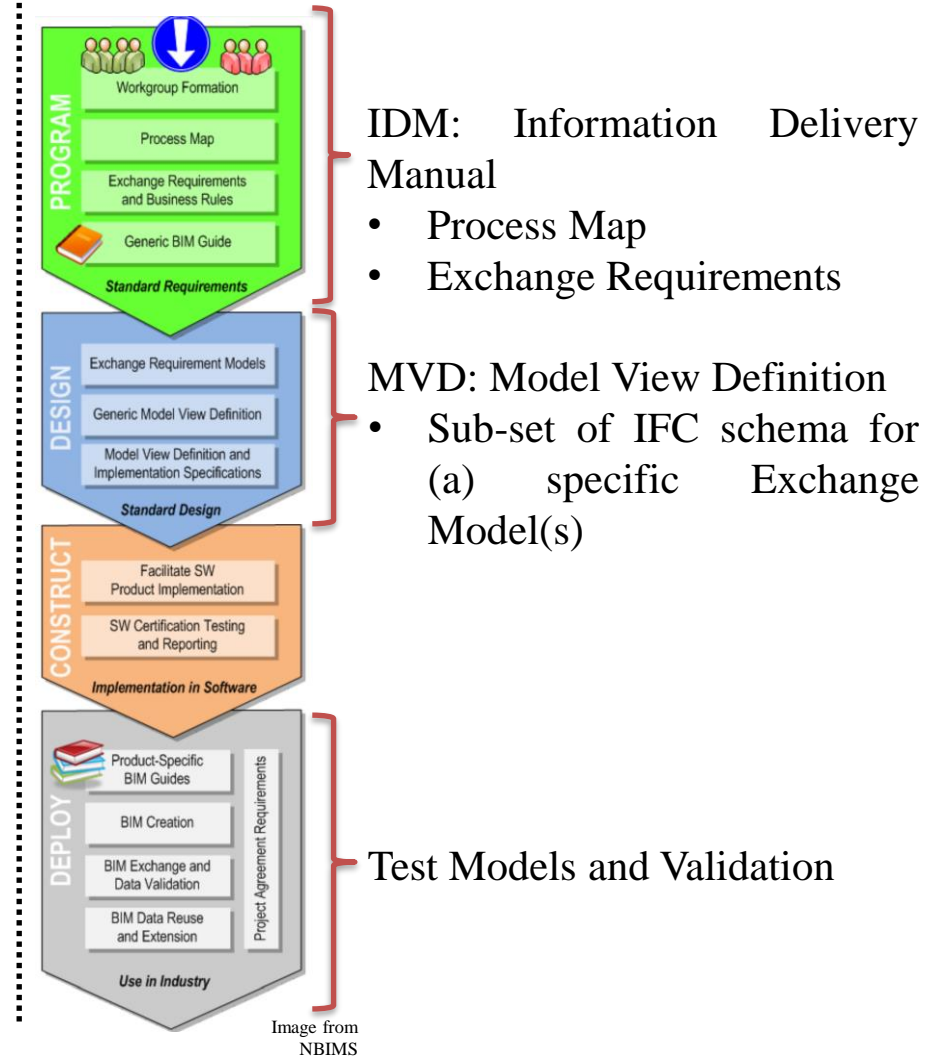

aci CONCRETE CONVENTION

- We don't need all the data in all the exchanges.
- We might need some additional data in some exchanges.

Table 7.3e—BarPosition property usage

Value	Meaning
BOTTOM	The bar is near the bottom face of the element. This should only be used for elements that are primarily horizontal.
INSIDE	The bar is near the inside face of the element. This value should only be used in elements with a clear inside and outside face.
CENTER	The bar is in the center of the element.
OUTSIDE	The bar is near the outside face of the element. This value should only be used in elements with a clear inside and outside face.
SIDE	The bar is on the side face of the element.
TOP	The bar is on the top face of the element. This should only be used for elements that are primarily horizontal.
(user-defined)	User defined values should only be used when none of the above values is appropriate.

EM.20 – Construction Reference Model

Pset_ACI_Schedule Property Set Usage:

This property set contains properties that describe the schedule information pertaining the Pour Object.

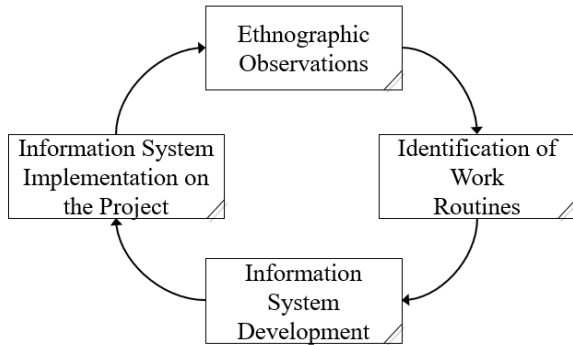

Property Name	Type	Usage	Required or Optional
ID	Alpha Numeric	A designation given to the object.	Required
Label	Text	Name of the object	Optional
Activity/Reference ID or Number	Alpha Numeric	A designation given to the object.	Optional
Start date	Date	Start Date of the Activity	Optional
Duration	Integer	Duration of the Activity	Optional
End Date	Date	End Date of the Activity	Optional
Sequence Information	Text	Order of the designated objects	Optional
Crew or resources	Alpha Numeric	Resources assigned to the object.	Optional
Production Rates	Number	Historical rate of placing the object.	Optional
Resource Utilization	Number	Number of resources used per the duration unit.	Optional
RFI	IFC Label	Associated RFI's to a pour object	Required
Concrete trucks spacing	Number	Time between concrete trucks in an hour Eg: 10 minutes spacing between trucks	Optional
Control Joints		Specified quantity location or spacing of control joints such as saw cuts, tooled edges for a pour object. Eg: 10' O.C Each Way	Optional
Revision	Alpha Numeric	Latest drawing revision of the object at the time of placement	Optional

Sample of Field Observation

Document No.	FO - 001 - SE/M
Document Type	Observation
Company/Discipline	Structural Engineering + Construction Coordination
Recording Method	Videocall
Date	4/15/2021
Duration	1.5 hours
Project	Healthcare Facility
Participants	Principal, Project Manager, Design Manager (responsible for project technical oversight), Lead Engineer, Lead Modeler, Technical Designer 1, Technical Designer 2, Director of Digital Practice.
Observations	<p>The goal of the work session is to discuss the concrete matrix and using it as a live schedule to track the material information on the concrete elements, and go beyond the conventional "dumb" text methods. The goal is to have live tracking of concrete properties and quantities.</p> <p>The building is a new patient tower and emergency podium made of Cast-in-Place Reinforced Concrete Building that will serve as an expansion to an existing healthcare facility. There is a small metal building and a pre-cast concrete parking deck outside of the scope of the meeting. The project is on the early design development (DD) phase, still dealing with schematic design (SD) decisions. The building is a Cast-in-Place reinforced concrete intermediate moment frame (IMF) building, with no shear walls. Foundations consist of piles and pile-caps. This is standard for many framed projects made of CIP RC.</p> <p>The process wants to go beyond referencing the strength of the concrete, and wants to be able to track the details of the mix used, and its association with the corresponding elements made of that mix. The concrete matrix wants to be able to associate to each element the concrete material parameters, or types of concrete mix. (This is closely related to the intent to transmit material information during the EM.6 and EM.20 exchanges).</p>

Sample of Process Observation

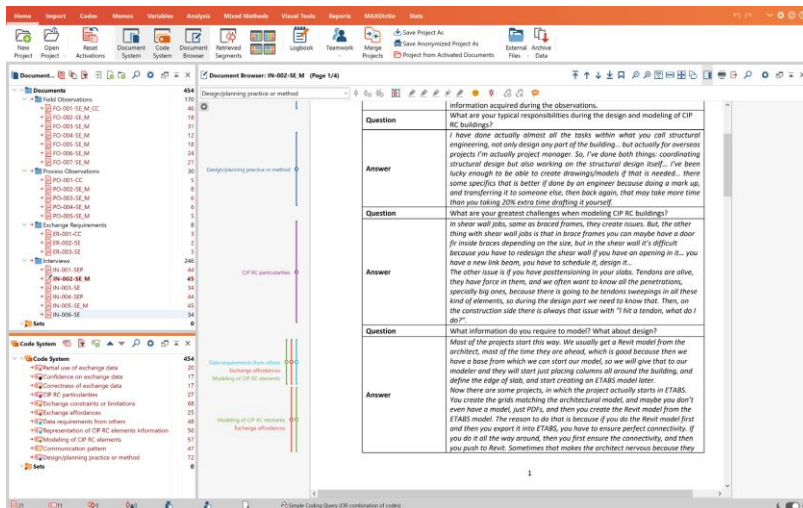

Document No.	PO - 002 - SE/M
Process	Framing Structural Design
Company/Discipline	Structural Engineering
Subject/Actor	Structural Engineer + Modeler
Recording Method	Videocall
Date	8/26/2021
Duration	1.5 hours
Tools Used	ETABS, Autodesk Revit, Kodiak
General Considerations	<p>The process intends to model and design CIP RC framing elements, particularly beams for vertical loads and deflections.</p> <ul style="list-style-type: none"> - Generate an analytical model in a structural analysis tool, to revise and correct the connectivity between the elements. Sometimes modeling starts in BIM tool, in which case the model is later pushed into the analytical model for connectivity revision and analysis. - Push model to BIM tool to add information and hold a structural BIM model for coordination. If modeling starts in BIM tool, model CIP RC elements in BIM tool (Revit), ensuring proper dimensions and 3D interactions. - Export the model with the proper connectivity to a central database or neutral file, that can be used to retrieve the geometry and connectivity. - Import the geometric model in the design tool and verify consistency in relationships and connectivity. - Assign loads and load patterns to the different elements based on the use of the facility. - Run the analysis and design program. - Verify force diagrams for logic, consistency, and output of design results. Note potential necessary connectivity and geometry adjustments.
Steps and Processes	

Sample of Interview

Document No.	IN - 002 - SE/M
Document Type	Interview
Company/Discipline	Structural Engineering
Subject/Actor	Structural Engineer 1
Recording Method	Videocall
Date	3/25/2022
Duration	1 hour
Description	This interview was intended to gather information from one of the key actors involved in the processes observed, and gain information on his perspective and approaches. This information is also used for triangulation with the information acquired during the observations.
Question	<p>How do you typically communicate design intent information to the detailer or contractor?</p> <p>Luckily we do have some tools internally. Let's talk about columns. We have a tool internally which lets us take the results from ETABS, and then process those results, because ETABS only yields area reinforcement, not number of bars, so we process that into number of bars and spacing. Then we push it to Revit which is the important part. Once it is in Revit we can create a column schedule from that.... The out of the box family does not have a lot of things that we want to populate, we have created parameters in the family... and our tool can populate that.</p> <p>For beams we also have an internal tool, Kodiak, which basically does design, and pushed that design into Revit. The design is pushed and also the labels are pushed. I mean the beam types, so if you do a beam schedule, it already there.</p> <p>We also have tools to create foundations. We have a tool that does that and then pushes it to Revit. The one that is a little bit green is shear walls, and link beams, we don't have any sophisticated tool that helps us push from ETABS to Revit. Let's say it's yellow. The design of a two-way slab has always been a challenge for any company, we do have an internal tool that has been developed. I think it's at 75%. It's pretty good but still needs some tweaks. Most of the times it's schedules.</p>
Answer	<p>Most of the projects start this way. We usually get a Revit model from the architect, most of the time they are already, which is good because then we have a base from which we can start our model, so we will give that to our modeler and they will start populating columns all around the building, and define the edge of slab, and start creating an ETABS model later.</p> <p>Now there are some projects, in which the project actually starts in ETABS. You create the grid matching the architectural models, and maybe you don't even have a model, just RIGs, and then you create the Revit model from the ETABS model. The reason to do that is because if you do the Revit model first and then you export it into ETABS, you have to ensure perfect connectivity, if you do it all the way around, then you first ensure the connectivity, then they push to Revit. Sometimes that makes the architect nervous because they</p>

		Modeling Productivity	(R. Sacks, C. Eastman, et al. 2005), (Dodge Data and Analytics 2015)	

Dimension	Category	Metric (Sources of Measurement)	Reference
Performance	RFIs	RFIs	(Barlish and Sullivan 2012), (Khanzode, Fischer and Reed 2008), (Giel and Issa 2013), (Abdirad 2016)
		RFI Reduction	(Dodge Data and Analytics 2015)
	COs	COs	(Barlish and Sullivan 2012), (Cannistraro 2010), (Giel and Issa 2013), (Abdirad 2016), (Kuprenas and Mock 2009).
		CO Processing Time	(Francom and Asmar 2015)
	Rework/ Errors	Rework	(Kuprenas and Mock 2009), (Khanzode, Fischer and Reed 2008), (Abdirad 2016)
		Errors & Omissions	(Abdirad 2016)
		Error reduction: design & drafting	(R. Sacks 2004)
		Completeness of Information	(Abdirad 2016)
		Illogical design	(Lee, Park and Won 2012)
		Discrepancies	(Lee, Park and Won 2012)
		Missing Items	(Lee, Park and Won 2012)
		Cost: Warranty & Latent Defects	(Francom and Asmar 2015)
		Material savings in design	(PwC 2018)
		Risk savings in design	(PwC 2018)
		Conflict Checking	(Kuprenas and Mock 2009)
		Coordination	(Khanzode, Fischer and Reed 2008)
		Safety	Safety
Reduction in Safety Incidents	(Dodge Data and Analytics 2015)		
Qualitative	General	Improved project definition	(R. Sacks 2004)
		Enhanced estimating accuracy	(R. Sacks 2004)
		Streamlined logistics	(R. Sacks 2004)
		Production automation	(R. Sacks 2004)
		BIM Sensible Value (BSV)	(Kim, et al. 2017)

Value Considerations

Metric	Value Considerations
Implementation Time	<ul style="list-style-type: none"> • Time required to implement standard processes varies based on IT capabilities • May take weeks but is a one-time investment
Information Production Time	<ul style="list-style-type: none"> • Time spent on information production varies depending on degree of automation • Structural information production w/ conventional methods: 30 min/1,000 CY • Construction information production w/ conventional methods: 15 min/1,000 CY
Reinforcement Detailing Time	<ul style="list-style-type: none"> • Manual set up of basic reinforcement: 45 min/1,000 CY • Manual QTO of reinforcement (early estimating): 15 min/1,000 CY
Construction Coordination Time	<ul style="list-style-type: none"> • Setting up the construction simulation and coordination: 20 min/1,000 CY • Subcontractor task durations vary, but re-modeling information is very time consuming • Most of this time could be saved by producing stakeholder w/ exchange standards
Errors & Omissions	<ul style="list-style-type: none"> • Several errors and omissions caught during the manual set up of models and information • Specific values for errors and omissions depend on modeler and proficiency with tools
